Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests is being reviewed by a contractor (SAI). After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant specific basis with a schedule keyed to inspection program update requirements.

Actions Requred to Complete the MPA:

Thirty-nine facilities remain to be reviewed in FY-82 in accordance with the attached schedule. Thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 1/25/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.
3. DL issue license amendment.

Status Updated: 4/16/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Lead Project Manager: W. Paulson

Priority: 1

Technical Review Branch(es): CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center is under contract for performing the review of the 47 remaining plants in this program. All (46) TERs have been received from Franklin Research Institute. No TER is exepcted for Dresden 1 which is on hold. Thirty-three SERs have been forwarded to DL by CSB; three of these need further work. Eighteen licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on 12 SERs in preparation for issuance. CSB needs to complete 10 SERs plus rework 3 SERs.

Status Updated: March 31, 1982

Multiplant Action Number A-10

Title Contingency Planning

Lead Project Manager E. McPeek

Priority High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

    a. 10 CFR Part 73, Appendix C
    b. Regulatory Guide 5.44
    c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (4) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-11

Title: Guard Training PLans

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

    a. 10 CFR Part 73, Appendix B
    b. NUREG-0674
    c. NUREG-0219
    d. NUREG-0576

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and ten (10) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued..

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by ORPMs, MEB and a contractor (EG&G). After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements.

Actions Required to Complete the MPA:

Sixty-four facilities remain to be reviewed in FY-82 in accordance with the attached schedule. For the reviews being conducted by MTEB or the contractor, thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 1/25/82

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number A-15

Title Quality Assurance Request Regarding Diesel Generator Fuel Oil

Lead Project Manager G. S. Vissing

Priority Low (3)

Technical Review Branch(es) PM ORB#4

Statement of Problem:
Consumable items where quality is necessary for functional performance of safety related components should also be classified as safety related and thus subject to applicable provisions of Appendix B to 10 CFR 50. DG fuel oil should therefore, be on the Q list or included in the QA program.

Background:
At ANO-1 IE found that DG fuel oil was not on their Q list or in their QA program. On investigation, we found this to be the case in other plants as well. Therefore, in January 1980, we requested all licensees to check their QA programs with respect to DG fuel oil and to include DG fuel oil in their QA programs or provide justification for not doing so.

Current Status:
Issue is complete for all affected plants.

Actions Required to Complete the MPA:
None

Status Updated 4/15/82

Multi-Plant Action No. A-16

Title: Qualification of Inspection, Examination, Testing and Audit Personnel

Lead Project Manager: Dave H. Jaffe

Priority; I

Technical Review Branch: QAB

Statement of Problem:

Guidance for the qualification requirements for inspection, examination, testing, and audit personnel has been incorporated in Regulatory Guides 1.58, Revision 1, and 1.146. This guidance should be implemented in a uniform manner by all power reactor licensees.

Background:

On May 4, 1981 Generic Letter 81-01 was sent to power reactor licensees and CP holders to request commitments to comply with certain regulatory positions presented in the subject Regulatory Guides.

Current Status:

All ooperating reactor licensees have responded to Generic Letter 81-01 and these responses are under review in QAB against the criteria of Regulatory Guide 1. 146 and Positions C.5, 6, 7, 8, and 10 of Regulatory Guide 1.58, Revision 1. As of April 8, 1982, MPA-A-16 has been resolved for 49 of the 72 scheduled facility reviews.

Action(s) Required to Complete the Licensing Action:

A close out letter is to be sent to licensees who provided an acceptable commitment to Regulatory Guides 1.58, Revision 1, and 1.146. As of April 8, 1982 letters have been sent closing out 42 of the 72 scheduled reviews.

Status Updated April 15, 1982

Multiplant Action No: B-01

Title: Diesel Generator Lockout

Lead Project Manager: T. Wambach

Priority:

Technical Review Branch(es): ORAB

Problem:

Some failures-to-start of diesel generators have been attributed to diesel generator lock-out involving critical timing of control circuit relay operation or reset following manual shutdown of the diesel. IE has transferred responsibility to Licensing to determine whether similar circuitry problems exist at other facilities and what corrective measures should be implemented.

Background:

By memo dated 1/26/77, DOT has requested that a survey be made of all operating plants to determine whether lockout or diesel generator operability is specifically annunciated in the control room for each diesel generator. A letter was sent to all operating reactors in March 1977. Review of responses has been completed.

Current Status:

Of the 63 units, 59 have been completed. NRC technical position has been documented to DL by ORAB.

Action(s) Required to Complete the Licensing Action:

Forward position to licensees of 4 remaining units. Obtain licensee commitment to meet position and write final letter closing out.

Status Updated: January 26, 1982

Multiplant Action Number B-03

Title PWR Moderator Dilution

Lead Project Manager Chris Nelson

Priority Low

Technical Review Branch(es) ORB #3

Statement of Problem:

All PWR licensees are to review potential for moderator dilution and verify that FSAR Moderator Dilution Event is most Limiting.

Background:

NaOH was inadvertently injected into the RCS at Crystal River Unit 3 via the DHR system during surveillance cycling of the NaOH tank's isolation valves. This was a previously unanalyzed source of moderator dilutor.

Current Status:

- PWR license es are required to analyze RCS moderator dilution by the contents of the spray additive system or show that this is not a source of moderator dilution.
- PWR licensees are to verify that FSAR moderator dilution event is most limiting.
- Franklin Research Center performing review under NRC contract NRC-03-81-130.

Actions Required to complete the MPA:

- Salem 1 is the only plant left to be reviewed
- FRC Draft TER returned with comments April 6, 1982

Status Updated:

April 15, 1982

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:
All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; (c) Technical Specifications. Twelve plants remain for which licensing action is required. SERs are available for three of the plants with only PM processing required. The remaining nine plants are being reviewed by contract with EG&G for reactor system aspects through RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the nine plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 4/16/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1

Lead Project Manager: Dick Clark

Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operating licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. Initial responses were received from all but one licensee and from all near-term applicants for operating licenses.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions Required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. Since MTEB could not begin the reviews this fiscal year, the proposed action is to have the reviews performed by INEL/EG&G. A revised statement of work, including MPA B-05, was mailed to the contractor on March 8, 1982. INEL has submitted a revised 189 for DL approval. If approved, INEL anticipates the reviews could be initiated by May 15, 1982. A total of 23 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY 83.

Status Updated: April 16, 1982

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:
By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:
1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize hydraulic snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-17 actions.
3) A total of 24 actions have been completed to date:

Actions Required to Complete the MPA:
1) 21 actions have been completed to date for FY82.
2) 4 additional actions required to meet FY82 schedule.

Status Updated: 4/16/82

Multi-Plant Action No. B-22

No. of Plants: 66

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem:
OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize mechanical snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-22 actions.
3) A total of 34 Actions have been completed to date.

Actions Required to Complete the MPA:

1) 17 actions have been completed to date for FY82.
2) 8 additional actions required to meet FY82 schedule.

Status Updated: 4/16/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Lead Project Manager: R Dudley

Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1982. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

69 - operating plants covered by B-23
54 - SERs completed (7 of which have open items)
44 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 22 remaining SERs. Complete the 25 remaining licensing actions.

Status Updated: April 1, 1982.

Multi-Plant Action No	B-24* *B-20 integrated into B-24 on 8/25/80
No. of Plants:	66
Title:	Venting and Purging Containment While at Full Power and Effect of LOCA
Priority:	High
Cognizant Assistant Director:	T. Novak
Cognizant Branch Chief:	S. Varga
Lead Engineer:	E. Reeves
Lead Technical Review Branch:	CSB/DSI
Other Review Branches:	EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980 and March 24, 1981 to all OL OR Branch Chiefs and Project Managers and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are managed by the Technical Review Team as follows:

   a. Electrical Reviews are managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews are managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements are managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews are managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB #1 (concurred in by CSB/DSI) was prepared for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review will complete TMI Item II.E.4.2, except for II.E.4.2.5 Containment Pressure Setpoint. However, CSB/DSI will provide SER's for II.E.4.2.6 and II.E.4.2.7 or will concur in SER's developed by Project Managers

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Project Managers should issue the update status of NRC reviews as soon as possible to each licensee using the sample letter (4 above). This is important to get the issue clearly understood by each PM and each licensee and to get the action completed. Lead PM records show that sixteen (16) plants have not been sent the status letter per the June 19, 1981 instructions. This letter should contain the staff guidance and any existing staff SER's received to date.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SER's and provide to Project Manager. Technical reviewers should also provide a status report to the Lead PM on TER's and SER's on a monthly basis.

3. Project Managers should review the licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

4. TMI Item II.E.4.2.5 reviews by CSB have been completed. SER's have been issued to licensees except for Crystal River 3 and Palisades. Project Managers should complete this action.

Status Update: 4/15/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking

Lead Project Manager: P. W. O'Connor

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Ten plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Eleven plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements.

Actions Required to Complete the MPA:

Complete the review of the deviations on the eleven remaining plants. Obtain commitments to follow NUREG-0619 guidance or issue orders requiring compliance if necessary.

Status Updated: January 26, 1982

Multi-Plant Action No. B-31
No. of Plants: 3
Title: Long Shaft LHSI and Outside Recirc Pump Degradation
Priority: Low
Cognizant Assistant Director: T. M. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Neighbors
Lead Technical Review Branch: EQB
Other Review Branches: ____________________

Problem:

Upgrade pumps at plants which have long shaft pumps. There were five plants in this category.

Background:

Excessive degradation occurred to bearings and shaft after short periods of operation of these pumps. Problems originally occurred at North Anna.

Current Status:

Complete.

Action(s) Required to Complete the Licensing Action:

None.

Status Updated: 4/6/82

Multi-Plant Action No. B-32

No. of Plants: 5

Title: Blocked SI Signal During Cooldown

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch ORAB (contractor)

Other Review Branches:

Problem:
NRR/DOL was requested by IE to determine the acceptability of blocking the steam line differential pressure safety injection signal during cooldown simultaneously with the blocking of the coincident pressurizer low level and low pressure signal. All PWR's should be reviewed for the same problem.

Background:
During an inspection at H. B. Robinson 2, it was found that during cooldown the licensee blocks the safety injection initiation signal from the high differential pressure between steam lines and the steam line header. This block is hard-wired into the same switch that is used to block the pressurizer low pressure and low level safety injection signal when primary pressure is below 2000 psig. The technical specifications (Table 3.5-3) allow blocking the pressurizer signals but do not address the blocking of the steam line high differential pressure signal.

We have also determined that Surry 1 and 2 and Turkey Point 3 and 4 have the same instrument and signal blocking arrangement and technical specification requirements as H. B. Robinson 2.

Current Status:

Robinson 2 submitted an amendment request and the amendment has been issued. A contractor report has been transmitted to the lead PM.

Actions Required to Complete the MPA:

The contractor report indicated that there are a total of 18 facilities that appear to have the same arrangement (10 sites). The lead PM is working out a plan of action to take. New TACs will be issued.

Status Updated: 4/16/82

Multiplant Action Number: B-34

Title: BWR-Jet Pump Integrity Assurance

Lead Project Manager: R. Bevan

Priority: Medium

Technical Review Branch: MTEB

Statement of Problem:

Since the failure of a jet pump holddown beam bar at Dresden 3 in February 1980, there has been renewed interest in jet pump integrity assurance. Jet pump failure and displacement can lead to difficulty in maintaining core covering in a LOCA for jet pump BWR's. Applies only to jet pump BWRs.

Background:

Occasional failure of retainer bolt keepers and related jet pump components since 1972 has sustained some level of interest in jet pump integrity. The more recent jet pump failure at Dresden and the subsequent discovery of beam bar cracking or crack indications (UT examination) at other plants has increased staff interest in this area.

Current Status:

Operating plants are monitoring jet pump action per IEB 80-06 and GE SIL 330. This action will continue until new improved beam bars are made available in sufficient quantity to change out all the older ones now shown to be subject to failure. GE is currently developing replacement pieces and IE is reviewing this activity and verifying acceptability as per TIA 80-16.

Actions Required to Complete the Licensing Action:

1) Review by MEB any proposed jet pump design changes
2) Develop plan/schedule for changeout of all beam bars, consistent with GE making such (approved) pieces available (these are under development at GE)
3) Evaluate need for jet pump ISI
4) Solicit appropriate TS changes from licensees for long term surveillance of jet pump integrity
5) Review licensee responses and revise TS as appropriate.

Status Updated: 4/16/82

Multiplant Action Number B-36

Title RTD Response Time

Lead Project Manager Monte Conner

Priority 2

Technical Review Branch(es) ICSB

Statement of Problem:

To accurately determine the response time for RTD used in the RPS.

Background:

With the adaptation of the STS definition of RPS response time requirements for primary sensors, the RTD portion of the response time became a difficult value to obtain. If the RTD is removed from its well in the RCS piping, how do you account for the well effect in finding the response time? New methodologies are now available to measure RTD response times directly during reactor operations.

Current Status:

By letters issued about July 1, 1981, this MPA was closed for the Calvert Cliffs Arkansas-2, Palisades, Millstone-2, Maine Yankee and St. Lucie units It has recently been issued for Ft. Calhoun. In October, 1981, a closeout package, that would send NUREG-0809 to all B&W and W units, was prepared. The problems with its issuance have recently been resolved; and its awaiting D. G. Eisenhut's signature.

Actions Required to Complete the MAP:

Get above package issued to all B&W and W utilities.

Status Update:

April 15, 1982

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-38

Title Tendon Surveillance - Bechtel Containments

Lead Project Manager Guy S. Vissing

Priority Low (3)

Technical Review Branch(es) SEB

Statement of Problem:
The problem involves the surveillance of post tensioned prestressed concrete containment tendons. The problem relates to the method used to interpret the results at the sampling and testing of tendons.

Background:
This task was first identified as a multi-plant issue in October 1977 when DOR put all outstanding issues into the RAMS system. It initially applied to ANO-1 and it involved some staff concerns on interpretations of the third year surveillance report for ANO-1 containment tendons. We found similar concerns were identified at other plants with post tensioned prestressed concrete containments. Therefore, we made it a multi-plant issue.

Current Status:
The recommendations for closing out this issue was acceptable to SEB and ORB#4 and appeared to be acceptable to D/DL and A/D OR. See the attachment. However, A/D OR has not yet approved the request.

Actions Required to Complete the MPA:
A/D OR approve request to delete MPA and notify all PMs

Status Updated 4/15/82

Multiplant Action Number: B-41

Title: Fire Protection - Final Tech Specs - Final SER Supplements

Priority: High

Lead Project Manager: T. Wambach

Review Branches: CEB, ASB, PSB, ICSB, RSB, PTRB, LQB

Statement of Problem:

Protection of safe, shutdown capability from the adverse effects of fire in any area of the plant. During the OL review of plants licensed prior to July 1976, no in-depth review was performed in this area.

Background:

Fire at Browns Ferry Nuclear Plant in March 1975 disabled redundant safety divisions and normal safe shutdown equipment. NUREG-0050.

Current Status:

10 CFR 50.48 and Appendix R to 10 CFR 50 became effective February 17, 1981. The licensees for 71 units licensed prior to January 1, 1979 and for 3 units licensed after January 1, 1979 have made submittals describing (1) plans and schedules to meet Appendix R, (2) design descriptions of alternative, safe shutdown modifications, and (3) exemption requests from Appendix R.

Action(s) Required to Complete the Licensing Action:

The submittals described above for all 74 units must be reviewed and acted upon by June 1982. This will entail issuing exemptions, exemption denials and SERs approving alternative or dedicated safe shutdown modifications. Review of new OLs is now incorporated in the SRP. Final Tech Specs covering the equipment added as a result of Appendix R must also be issued after the modifications are complete.

Status Updated: January 28, 1982

Multiplant Action No.: B-43

Title: PWR Feedwater Line Cracks - Long Term Corrective Action

Lead Project Manager: Sydney Miner

Priority: Medium

Technical Review Branch(es): Materials Engineering Branch
Program Evaluation Branch

Statement of Problem:

Leaking Circumferential cracks were detected in Feedwater lines of both Westinghouse and Combustion Engineering facilities in the immediate vicinity of the steam generator nozzles.

Background:

The first incident of cracking occurred in May of 1979 in the feedwater lines of D.C. Cook Unit 2. This event prompted issuance of IE Bulletin 79-13 requiring inspection of all PWR feedwater lines.

Results of these inspections (17 incidents of cracking at 35 plants examined) led to the formulation of the PWR Pipe Crack Study Group (PCSG). Immediate short-term corrective actions taken by IE were directed towards restoration of the piping to its original condition.

In a memorandum dated September 19, 1980, Ed Jordan of IE described the short-term actions as complete. Also, in referring to the PCSG final recommendations, he suggested that augmented ISI requirements extending beyond the next refueling be imposed by Technical Specifications tailored for each facility. He further suggested that NRR should develop positions on permanent measures necessary to prevent recurrance.

Subsequently, the Materials Engineering Branch (MTEB), Division of Engineering, NRR agreed to provide a memorandum on the above. However, prior to transmitting new licensing requirements to DL, MTEB coordinated the implementation of PCSG recommendations with the Division of Safety Technology (DST) through a value/impact study. In addition, the Division of Engineering agreed with a DST recommendation that a risk agreement would complement the deterministic analysis performed by the PCSG and aid in long term implementation.

Current Status:

1. Acceptance Criteria:

   The Division of Safety Technology in response to a February 22, 1981 request by Division of Engineering did a risk evaluation of thermal fatigue cracks in PWR feedwater lines. In a memorandum dated July 21, 1981, the Division of Safety Technology stated through their analysis shows a low probability of core melt due to feedwater line breaks they believe that some additional steps should be taken to prevent feedwater line cracks. The Division of Engineering has not yet finalized and issued their recommendations for the long term measures

to be taken to prevent feedwater line cracks.

2. Important Schedule Considerations:

The current schedule requires completion of the first 9 reviews and issuing of the SER's in the second quarter of 1982. The long term measures have not been issued to date. Since these will result in new or additional requirements on licenses I expect that the CRGR may want to review them. Therefore, by the time the requirements are issued, approved, sent to the licensees, licensees respond and the responses are reviewed the elapsed time will be well beyond the second quarter.

3. Branch Responsibilities

The Safety Program Evaluation Branch (SPEB) of the Division of Safety Technology has completed their risk assessment of a core melt due to a feedwater line rupture core due to thermal fatigue. They will assist the Materials Engineering Branch (MTEB) in making any additional evaluations should the MTEB decide that additional evaluations are required. The MTEB will recommend the long term measures that are required. The Division of Licensing will transmit these long term requirements to the licensee. The MTEB will review the licensees responses and issue a SER.

Actions Required to Complete MPA:

1. Issuance of a memorandum by DE to DL recommending their proposed long term actions.
2. Preparation of a set of instructions to Project Managers on long term actions required (this could be a generic letter depending on whether or not there are any plant specific requirements).
3. Issuance of a letter to the licensee setting forth the new requirements.
4. Review of licensee's responses and revision of corresponding Technical Specifications as required.

33 Licensing actions are involved in all these activities.

Status Update: April 16,1982

Multi-Plant Action No. B-46
No. of Plants: 70
Title: Analysis of Turbine Disc Cracks
Priority: Medium
Cognizant Assistant Director: T. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: W. J. Ross
Lead Technical Review Branch: Material Engineering
Other Review Branches: ____________

Problem:

Monitor U. T. inspections of W and GE low pressure turbine discs for keyway cracks.

Background:

Inspections by W since 10/79 have revealed novel stress corrosion cracks in keyway and bore regions of low pressure turbine discs.

Current Status:

Staff action complete. Lead engineer monitoring W and GE activities.

Action(s) Required to Complete the Licensing Action:

None.

Status Update: 4/7/82

Multiplant Action Number: B-48

Title: Adequacy of Station Electric Distribution Voltage

Leak Project Manager: R. Dudley

Priority: 2

Technical Review Branch(es): PSB

Statement of Problem:

This review is intended to determine if the onsite distribution system in conjunction with the offsite power sources has sufficient capacity and capability to automatically start and operate all required safety loads within the equipment voltage rating.

Background:

At Arkansas Nuclear 1, loss of offsite power indicated that the electric distribution systems were inadequate for two unit operation. All utilities were asked to review their distribution systems to see if voltages were adequate.

Current Status:

71 - operating plants covered by B-23
42 - SER's completed (10 of which have open items)
26 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the remaining 39 SER's.
Complete the remaining 45 licensing actions.

Status Updated: APRIL 1, 1982

Multi-Plant Action No. B-49

No. of Plants: 17

Title: PWR Control Rod Misalignment

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch: ORPM - Lead Engineer

Other Review Branches: Core Performance Branch

Problem:

Older Westinghouse Plant's Technical Specifications did not provide requirements to ensure compliance with assumptions used in various analysis regarding control rod alignment.

Background:

Letters were sent to all Westinghouse PWRs on October 29 or November 5, 1979 requesting revisions to their TS (if needed) to ensure rods were aligned within 15 actual inches or 7.5 indicated inches.

Current Status:

1. License amendments issued on 14 plants.
2. Awaiting TS proposal on 2 plants (Surry 1 and 2).
3. Reviewing latest proposal from Kewaunee.

Action(s) Required to Complete the Licensing Action:

1. Review proposed TS from remaining plants when received.

2. Negotiate an ageeement with remaining plants.

Status updated: April 6, 1982

Multi-Plant Action No. B-57

No. of Plants: 44

Title: Decay Heat Removal Capability

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. DeAgazio

Lead Technical Review Branch None

Other Review Branches:

Problem:

To assure redundancy in decay heat removal capability by incorporation of requirements into the Technical Specification.

Background:

Various events at PWRs that have occurred during shutdown conditions have indicated that administrative controls to assure decay heat removal capability have been inadequate. All PWR licensees were requested (in a letter dated June 11, 1980) to incorporate requirements for redundancy into their TSs.

Current Status:

Acceptance criteria are: (1) redundancy in decay heat removal capability must be provided for all modes or temperature ranges of operation, particularly in Modes 4, 5 and 6, and (2) adequate surveillance requirements must be provided. A total of 16 plants remain to be reviewed. Indian Point 2 and 3 have not responded to our original request. Kewaunee, Crystal River 3 and Palisades responsed but did not propose new Technical Specifications because they believed that their current Technical Specifications are adequate.

INEL is reviewing submittals and identifying where the proposed TSs, in conjunction with existing TSs, do not conform with our Standard TSs.

Actions Remaining:

1) Review applicable sections of the Kewaunee, Crystal River 3 and Palisades Technical Specifications
2) Review TER's as they are completed. Decide whether deficiencies are serious enough to warrant additional requests to licensees. If not, issue the license amendment as requested.

Status Updated: 4/16/82

Multiplant Action No. B-58a

No. of Plants: All BWRs

Title: BWR Scram Discharge Volume Technical Specifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ORB#2

Statement of Problem:

Common cause failures of instrument volume level switches. Precursors at Hatch and Brunswick resulted in IE Bulletin 80-14.

Background:

Model Technical Specifications were sent to the industry by letter dated July 7, 1980. Submittals were subsequently received from the affected licensees and are being reviewed by the Franklin Research Center.

Current Status:

NRC contract NRC-03-81-130 has been issued to Franklin Research Center to review licensee submittals and write TERs. Final TERs for 15 plants have been received as of 4/15/82.

Action Required to Complete the MPA:

Issue license amendments upgrading TS after receipt of TERs.

Status updated: April 16, 1982

Multiplant Action No. B-58b

No. of Plants: All BWRs (except LACBWR) - 23

Title: BWR Scram Discharge Volume Long Term Modifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ASB

Statement of Problem:

Concerns raised as a result of the partial failure to scram event at Browns Ferry 3 on June 28, 1980 were documented in the staff's Safety Evaluation Report on the BWR Scram Discharge System dated December 1, 1980. A letter was issued on October 1, 1980 requesting a commitment to conform with revised criteria.

Background:

A letter dated December 9, 1980 forwarded the staff's generic SER with revised criteria. A letter dated March 30, 1981 provided clarification of the requirement for diverse instrumentation.

Current Status:

OMB clearance has been received and orders will be issued in near future.

Actions Required to Complete the MPA:

Obtain acceptable responses and commitment dates. Issue orders with model Technical Specifications. Issue NRC contract to FRC to perform post-implementation verification.

Status updated: April 16, 1982

Multi-Plant Action No. B-59

No. of Plants: 70

Title: Masonry Wall Design

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Charles Trammell

Lead Technical Review Branch SEB, SEPB

Other Review Branches:

Problem:
Inadequate design criteria for masonry walls. Applies to all plants.

Background:
Problem was discovered at Trojan during reviews associated with IEB 79-02 (anchor bolts) and IEB 79-14 (As-built verification). A masonry wall was found which supported numerous safety-related pipes which was not adequate to resist seismic forces. This resulted in the issuance of IE Bulletin 80-11 on May 8, 1980. NRR (SEB) has been assigned the responsibility to review licensee's responses to this Bulletin.

Current Status:

Franklin Research Center has been contracted to review most licensee submittals (exceptions: Trojan, Cooper, Dresden 1, Humboldt Bay, LaCrosse, Yankee-Rowe, San Onofre 1). Trojan and San Onofre 1 are being reviewed by SEB. LaCrosse and Yankee-Rowe will be reviewed by SEPB. Dresden 1 and Humboldt Bay are currently in a shutdown status, and will be reviewed by SEB if/when needed. Cooper has no safety-related masonry walls covered by IEB 80-11. Close-out letter for Cooper has been issued (2/17/82). Review schedule and acceptance criteria for review have been established.

Actions Required to Complete the MPA:
69 plants remain to be completed. One finished to date. FRC review is active.

Status Updated: 4/16/82

Multiplant Action Number: B-60

Title: Environmental Qualification of Electric Equipment for
Nuclear Power Plants

Lead Project Manager: Jose A. Calvo

Priority: 1

Technical Review Branch: Equipment Qualification Branch

Statement of Problem: All plants are required to meet the Commission Memorandum and Order CLI 80-21 concerning 10 CFR 50, Appendix A, GDC 4.

Background: The issue originated from a 1977 petition from the Union of Concerned Scientists on fire protection and equipment qualification. The multiplant action arose from the Commission Memorandum and Order CLI 80-21. Technical resolution of acceptance criteria were produced from Unresolved Safety Issue A-24.

Current Status: Licensee submittals under review by Franklin Research Center. A proposed rule was issued for public comment on January 20, 1982. Comments were due on March 22, 1982 and are in the process of being evaluated.

Actions required to complete the MPA: Final SERs must be issued for all plants. The schedule for completion, contingent on the proposed rule, will be no later than November 30, 1985.

Status Updated: April 16, 1982

Multiplant Action Number B-61

Title: IE Bulletin 79-27, Loss of Non Class IE Instr. and Control Power

Lead Project Manager: M. Fairtile

Priority: 2

Technical Review Branch(es): ICSB

Statement of Problem:

Loss of "non-nuclear" instrumentation power has caused loss of instruments needed to guide operators to safely shutdown the plant during a concurrent transient caused by the same power loss. In addition erroneous inputs have been fed into the control systems of B&W plants.

Background:

IE Bulletin 79-27 was issued on November 30, 1979 due to a total loss of power to a non-safety class IE 120 volt AC power supply to the Oconee 3 integrated control system and non-nuclear Instrumentation System. On February 26, 1980 there was a power failure in a DC non-nuclear instrumentation system at Crystal River 3 that resulted in both IE and ONRR writing Orders to utilities that hadn't yet responded by February 26, 1980 to the Bulletin.

Current Status:

ICSB has reviewed all the responses to the Bulletin.

Actions Required to Complete the MPA:

DSI will report results of review to DL. The Lead Project Manager is of the opinion that the NRR portion of the Bulletin review can be closed-out by June 30, 1982.

Status Updated: April 15, 1982.

Multi-Plant Action No. B-62

No. of Plants: 70

Title: ESF Reset Control Design Difficiency IE Bulletin 80-06

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: Sydney Miner

Lead Technical Review Branch ICSB

Other Review Branches:

Problem:

Certain equipment would return to its normal mode following the reset of an ESF signal. This protective action of the affected systems could be compromised once the associated actuation signal is reset.

Background:

On March 13, 1980, the Office of Inspection and Enforcement issued Bulletin 80-06, "Engineered Safety Feature (ESF) Reset Controls," to address the concern that the use of reset pushbuttons alone could permit certain engineered safety feature systems components to revert to the normal state following safety system actuation. The bulletin specified actions to be taken by licensee to address these concerns. By Task Interface Agreement, ROI 80-15, the Office of Nuclear Reactor Regulation was assigned responsibility for evaluating the licensee's responses to the Bulletin.

Current Status:

1. Acceptance Criteria
   Unless an alternative is justified by the licensee and the justification is acceptable, upon reset of ESF signals all affected equipment shall remain in its emergency mode. If there is multiple sequencing, none of the reset actions shall cause the affected equipment to deviate from its emergency mode.

2. Important Schedule Considerations
   20 additional licensing actions are scheduled to be completed this year. All of the remaining 15 SERs are scheduled to be issued this year.

3. Identification and Role on the Contractors
   The detailed technical review of the licensees responses to I&E Bulletin 80-06 is being performed by EG&G Sam Ramon under DL's technical assistance contract with Lawrence Livermore National Laboratory. Upon completion of their review EG&G issues a Technical Evaluation Report (TER).

Required to Complete MPA:

1. EG&G complete review and issue TER	4 actions
2. Review TER and issue SER	15 actions
3. Issue SER to licensees	26 actions

Status Updated: 4/16/82

Multiplant Action Number B-63

Title Emergency Procedures and Training for Station Blackout

Lead Project Manager Chris Nelson

Priority High

Technical Review Branch(es) ORB #3

Statement of Problem:

All plants are required to implement emergency procedures and training for station blackout events (loss of all onsite and offsite ac power)

Background:

ASLAB (ALAB-603) concluded that station blackout should be considered a design basis event for St. Lucie 2.

NRC staff currently assessing station blackout on a generic basis (USI A-44)

Station Blackout procedures and training determined advisable action prior to completing A-44.

Current Status:

Generic letter 81-04 sent 2-25-81 requesting all plants (except St. Lucie 1&2) implement emergency procedures and training.

All but three plants have indicated procedures and training will be implemented on an acceptable schedule.

Actions Required to Complete the MPA:

Letters must be sent to 3 acceptable plants closing issue.

Letters must be sent to 2 plants requesting information

Response from one plant must be evaluated

Status Updated:

April 15, 1982

Multiplant Action Number: B-64

Title: B&W Accident Induced Neutron Flux Errors

Lead Project Manager: R. Jacobs

Priority: 3

Technical Review Branch(es): CPB (Physics Section)

Problem:

By letter dated October 29, 1980, B&W (J. H. Taylor) to IE (V. Stello), B&W stated that a study of accident-induced neutron flux errors, indicates a possible error in the FSAR analyses in the non-conservative direction affecting both 177FA and 205FA cores. IE transferred the technical review aspects to ONRR by TIA ROI 80-43 signed by Eisenhut on November 26, 1980.

Background:

By memorandum dated January 14, 1981, Eisenhut to Novak, the Multiplant Program B-64 was established, and transmitted questions, same date, to all B&W licensees. Responses came in dated from mid-March to mid-April 1981. The responses were routed to the Core Performance Branch for review. (H. Richings is reviewer).

Current Status:

All licensee responses submitted to NRC. SERs issued to DL in April 1982.

Actions Required to Complete the MPA.
DL review SERs from CPB and issue them to licensees. No TS changes will be required.

Status Updated: April 16, 1932

Multiplant Action No. B-65

No. of Plants: All BWRs (except LACBWR) - 23

Title: Safety Concerns Associated with Pipe Breaks in BWR Scram System

Lead Project Manager: K. Eccleston

Priority: High

Lead Technical Review Branch: ORAB

Other Review Branches: ASB, PTR, EQB, RAB, AEB, RRAB, CSB, RSB, ORB#2, ICSB, OLB, SPE

Statement of Problem:

Assess the overall risk to long-term core cooling from postulated pipe break in Scram Discharge Volume; investigate the mitigation capability for the postulated event; establish generic recommendations for correcting any deficiencies identified.

Background:

Draft NUREG-0785 issued April 3, 1981 by AEOD described certain safety concerns associated with postulated pipe breaks in the BWR Scram System. NRC letter dated April 10, 1981 to all BWR licensees requested a generic evaluation of the concerns within 45 days and a plant specific review within 120 days. The generic evaluation was submitted by GE on behalf of the BWR owners by letter dated April 30, 1981.

Current Status:

NUREG-0803 was issued to BWR licensees and applicants on 8/31/81. Plant specific licensee responses to concerns identified in this NUREG are being evaluated.

Action Required to Complete the MPA:

Review licensee's plant specific responses to the guidance contained in NUREG-0803.

Status updated: April 16, 1982

Multiplant Action Number B-66

Title Natural Circulation Cooldown

Lead Project Manager Chris Nelson

Priority Medium

Technical Review Branch(es) RSB

Statement of Problem:

All PWRs must review plant cooldown on natural circulation to determine if voiding will occur in the reactor vessel.

Background:

St. Lucie Unit 1, while cooling down on natural circulation due to a component cooling water malfunction, developed a steam space in the upper head of the reactor vessel.

Core cooling was not lost however complex situation deemed on undesirable challenge to the operator.

Current Status:

Generic letter 81-21, issued May 5, 1981, requested:

1. demonstration that natural circulation cooldown by procedure should not result in reactor vessel voiding
2. verification that supples of condensate grade aux feedwater are sufficient
3. aspects of training and procedures dealing with this subject

All licensees but one responded

Westinghouse Owners Group Generic Report (OG-57) dated 4-20-81

Actions Required to Complete the MPA:

Receive outstanding licensee response

Review all responses as well as Generic Westinghouse Report

44 actions remain-none scheduled for FY82

Status Updated:

April 15, 1982

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-67

Title Pressurized Thermal Shock to Reactor Pressure Vessels

Lead Project Manager Guy S. Vissing

Priority 1

Technical Review Branch(es) ORAB, MTEB, RSB, CPB, PTRB, GIB, RRAB

Statement of Problem:

Concerns a possibility that in PWRs pressure vessels could be subjected to severe overcooling transients followed by repressurization which could threaten the integrity of the RPVs.

Background: Pressure vessel thermal shock has been considered for many years in the context of assuring integrity in the vessel when subjected to cold emergency core cooling water during a large LOCA. Based on fracture mechanics analyses verified by enforcements, it was concluded that a postulated flow would not propagate through the vessel wall during a large LOCA. As a result of operating experience it was subsequently recognized that there could be transients in PWRs in which the vessel could be subjected to severe overcooling (thermal shock) followed by repressurization. In these pressurized thermal shock (PTS) transients, vessels could be subjected to pressure stresses superimposed upon the thermal stresses resulting from the temperature differences across the vessel wall. By letter dated April 20, 1981, we requested the PWR Owners Groups to address this problem and the licensees of operating PWRs to provide a response.

On the basis of our review of the PWR Owners Groups' responses and the PWR licensees' responses to our letter of April 20, 1981, and on the basis of our independent analysis, we determined that all operating plants could survive a severe overcooling event for at least another year of full power operation. However, for plants where neutron irradiation has significantly reduced the fracture toughness of the reactor pressure vessels (RPV), we decided that action should be taken to resolve the long term problems. Accordingly, under 10 CFR 50.54(f), by letter dated August 21, 1981 we requested from licensees of eight plants (based on the reference temperatures of the RPV and system characteristics), information concerning the issue of PTS to RPV. Specifically we requested within 60 days information related to: (1) the Reference Temperature for Nil Ductility Transition (RT_{NDT}) for the RPV and (2) operator action to prevent pressurized thermal shock and ensure vessel integrity. Also, we requested within 150 days information which would define actions and schedules for resolution of the PTS issue and analyses to support continued operation.

The eight plants selected were: Fort Calhoun, Robinson 2, San Onofre 1, Maine Yankee, Oconee 1, Turkey Point 4, Calvert Cliffs 1 and Three Mile Island 1.

By Commission Paper SECY 81-687 dated December 8, 1981, PTS was designated as an Unresolved Safety Issue. However, at the Commission briefing of November 24, 1981, we committed to having a staff position by Summer 1982 and by memorandum dated November 24, 1981 (Harold Denton to D. Eisenhut and S. Hanauer) Harold Denton directed that for those plants of immediate concern DL should manage the development of a short term resolution which can meet the scheduled committed to the Commission (Summer 1982).

Current Status:
The "60 day" responses have been received and by letters dated December 18, 1981, we provided to the eight licensees our evaluation and request for information which should be submitted with the "150 day" responses. TACs were issued and closed out for the 60 day responses. TACs have been issued for the short term resolution of the 150 day responses. A TAC has also been issued for the review of the Westinghouse and CE generic reports for the short term resolution for those plants other than the eight. Attachment 1 provides a typical TAC for the eight plants. Attachment 2 provides the TAC for the plants other than the eight. Under Requesting Remarks of each TAC is provided scope of work, responsibilities, plan and tentative schedules.

Action Required to Complete MPA:

Perform SER (one for each plant on one report which addresses all plants), issue and send to licensees.

Multi-Plant Action No. B-69

No. of Plants: 47 Operating Reactor Plants

Title: PWR Main Steam Line Break with Continued Feedwater Addition

(IE Bulletin 80-04)
Priority: High

Cognizant Assistant Director: T. M. Novak

Lead Engineer: R. A. Clark

Lead Technical Review Branch: CSB/DSI

Other Review Branches: RSB, ICSB/DSI

Problem:

A licensee submitted a report to NRC identifying a deficiency in the original main steam line break (MSLB) analysis for their plant. They determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system also had not been considered in prior analyses.

Background:

Virginia Electric and Power Company (VEPCO) submitted a report to the Nuclear Regulatory Commission (NRC) dated September 7, 1979 identifying a deficiency in the original main steam line break (MSLB) analysis for North Anna Power Station, Units 3 and 4. Stone and Webster Engineering Coproration re-analyzed the containment pressure response following a MSLB and determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system had not been considered in prior analyses.

On October 1, 1971, IE Information Notice No. 79-24 was sent to all holders of operating licenses and construction permits, informing them of VEPCO's finding. The Consumer Power Company of Michigan (Palisades, Unit 1 facility) conducted an accident analysis review pursuant to the Information Notice and found that with offsite power available, the condensate pumps would feed the affected steam generator at an excessive rate. This was not considered in their analysis of the MSLB accident.

Because of the deficiencies that were identified in the original MSLB analyses, IE Bulletin No. 80-04 was issued on February 8, 1980. The IE Bulletin requested licensees and certain applicants of PWR facilities to assess the effect of continued feedwater or condensate addition on the containment response and reactor core reactivity response to a MSLB accident. The IE Bulletin was sent to all licensed PWR facilities and to those PWR facilities nearing licensing (Diablo Canyon, McGuire, North Anna 2, Salem 2, and Sequoyah).

Current Status:

As of May 1, 1981, 46 PWR licensees have responded to IE Bulletin 80-04. On August 17, 1981, Franklin Research Center was authorized to begin work reviewing the responses to IE Bulletin 80-04. As of April 16, 1982, Franklin Research Center concluded that some licensee submittals did not provide adequate information for them to complete their review; licensees are being requested to provide the additional information. This assignment is expected to be completed by the contractor by September 30, 1982.

Action(s) Required to Complete the Licensing Action:

1) Review licensees' response to IE Bulletin 80-04.
2) Evaluate licensees' responses.
3) Evaluate licensees' corrective actions.
4) Issue Safety Evaluation Report on licensees' response and corrective actions.

Multi-Plant Action No. C-01
Title: PWR Secondary Water Chemistry
Lead Project Manager: Robert B. A. Licciardo
Priority: 2
Technical Review Branch(es): ChEB

Statement of Problem:

PWR facilities only are affected. The NRC staff's testimony at the January 1976 Prairie Island public hearings on steam generator tube integrity set forth the regulatory position regarding secondary water chemistry monitoring requirements. The NRC position is that monitoring requirements are needed to assure control of harmful impurity buildup in the steam generator that could cause tube corrosion and impair tube integrity.

Background:

Letters were sent to PWRs requesting Technical Specifications changes to incorporate Secondary Water Chemistry monitoring requirements; a number of licensees objected to this approach on the basis of potential limitations to plant operating flexibility. NRC changed its position and requested a license condition that requires the implementation of a secondary water chemistry monitoring and control program containing appropritae procedures and administrative controls.

Current Status:

Six plants remain to be closed out. Many facilities were resolved by ORPM's owing to a lack of Technical Review priority in the post TMI period. Recent scheduling of tasks inside the NRC has made Technical Review capacity again available enabling planning for a relatively early completion.

A contractor is now involved; this is Brookhaven National Laboratories. All actions are scheduled for completion this fiscal year.

Action(s) Required to Complete the MPA:

Outstanding licensee submittals have been reviewed. Requests for additional information have been sent to related ORPMs.

NRR/ORPM is reviewing the request for additional information.

Status Updated: April 16, 1982

Multi-Plant Action No. C-03

No. of Plants: 3 Plants Remaining (Kewaunee, Peach Botton 1&2)

Title: Qualification of Radiation Protection

Priority: N/A

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert Clark

Lead Engineer: Dom DiIanni

Lead Technical Review Branch: NONE

Other Review Branches: DL

Problem:

Issue license amendments commiting the licensee to meeting the requirements of Reg. Guide 1.8 for the qualification of the Radiation protection manager.

Current Status:

All licensees have committed to this requirement and the Tech Specs have been revised accordingly except for the licensee's of the Kewaunee and Peach Bottom 1&2 Nuclear power plants. License amendments for these three plants need to be issued in order to complete MPA. This effort is with DL and it appears the action can be completed during 2nd quarter of 1982.

Action(s) Required to Complete the Licensing Action:

The PMs for Kewaunee (R. Licciardo) and Peach Botton 1&2 (M. Fairtile) are to issue an amendment to the licensee that commits the licensees.

Status Updated 1/21/82

Multiplant Action Number C-04

Title ESF Filter Tech. Specs.

Lead Project Manager C. Tropf

PRIORITY 3

Technical Review Branch (es) ETSB

Statement of Problem:

Some licensee have not submitted T. S. Regarding ESF filters which comply with the position of RG 1.52

Background:

Letters sent out in 1976-1977 to all licensees. Most have been completed.

Current Status:

7 plants are outstanding. All T. S. to be issued by 9/82.

Actions Required to Complete the MPA:

Resolve open items in reviews. Project Managers are pursuing

Status Updated April 1982

Multiplant Action Number: C-06

Title: Pump Support - Lamellar Tearing

Lead Project Manager: R. Emch

Priority: 2

Technical Review Branch: GIB

Statement of Problem:

The potential for low fracture toughness and lamellar tearing on steam generators (including vessel, pressurizer and torus supports) exists due to variability in fracture toughness and resistance to corrosion of support materials.

Background:

Was unresolved safety issue A-12. Additional complication is that supports other than integrally welded are not covered in ASME Code and GDC and may require rule-making. Resolution of issue will occur with issuance of the "Final" NUREG-0577 in early 1982.

Current Status:

1. Acceptance criteria will be provided in NUREG-0577
2. No schedule has been set.

   GIB/DST (Dick Johnson) has responsibility; however, 6 plants (Indian Point 2/3, San Onofre 1, Turkey Point 3/4, and Arkansas 2) will be reviewed under FRC contract (Bill Koo). These plants did not provide adequate information orginally. Preliminary reviews have been completed onthese 6 plants, but the detailed review is waiting for guidance of NUREG-0577.

Actions Required to Complete the MPA:

Completion of NUREG-0577 is first step. Further steps to be determined based on guidance in NUREG.

Status Updated: January 27, 1982

Multiplant Action Number: C-07

Title: Fuel Handling Accident Inside Containment

Lead Project Manager: C. Tropf

Priority: 2

Technical Review Branch(es): ______

Statement of Problem:

By letter dated January 3, 1977 to Commissioner Gilinsky, Mr. Robert Pollard recommended that NRR review the potential consequences of a postulated fuel handling accident at each operating plant because this accident had not been considered during licensing of the plants.

Background:

Letters were sent to licensees of 39 operating plants in January 1977 requesting that they provide a detailed evaluation of the potential consequences of this accident. Letters were not sent to licensees of 24 operating plants because this accident had been evaluated in their SER.

Current Status:

There are 4 plants which are not complete. The issues range from concerns regarding X/Q to acceptability of filers.

Action Required to Complete the MPA:

The project managers are pursuing resolution of the remaining issues.

Status Updated: April, 1982

Multi-Plant Action No. C-10

No. of Plants: 54

Title: Control of Heavy Loads at Nuclear Power Plants

Priority: Phase I, High; Phase II, Medium

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert A. Clark

Lead Engineer: Glode Requa

Lead Technical Review Branch: Auxiliary Systems Branch

Other Review Branches: None

Problem: Dropped Heavy Loads may impact spent fuel, fuel in the core, or equipment that may be required to achieve safe shutdown and continued decay heat removal for PWRs and BWRs. If sufficient spent fuel or fuel in the core were damaged and if the fuel is highly radioactive, the potential releases of radioactive material could result in off-site doses that exceed 10 CFR Part 100 limits.

Background: USI - Task A-36 was established to examine staff licensing criteria, the adequacy of measures in effect at operating plants, and to recommend necessary changes to assure the safe handling of Heavy Loads. NUREG-0612 provides the results of the review and includes the task groups recommendation.

Current Status: NUREG-0612 was issued to all licensees by letter dated December 22, 1980. The letter requested; interim actions to be completed in 90 days, a Phase I Action (report, confirmation and justification) in six months and Phase II (specific requirements) in nine months.

The criteria contained in NUREG-0612 is used for the acceptance criteria. Schedules have been established provide 59 technical inputs to DL for FY82 from the contractor for Phase I only. The contractor is Franklin Research Center (FRC). FRC provides TER's to the lead technical group ASB.

Actions Required to Complete the Licensing Action:

1. Review licensees Phase I submittals, resolve any staff disagreements with submittals and issue a SER to licensee.

   50 TERs are to be completed in FY82.
   13 TERs are to be completed in FY83.
   50 SERs to licensees are scheduled for FY82.
   22 SERs to licensees are scheduled for FY83.

2. Review licensee's Phase II submittals same as item 1.

   40 TERs are scheduled for completion during FY83.
   32 TERs are scheduled for completion during FY84.
   40 SERs are scheduled for completion during FY83.
   32 SERs are scheduled for completion during FY84.

Status updated 1/21/82.

Multiplant Action Number: C-11

Title: Reactor Protection System (RPS) Power Supplies

Lead Project Manager: J. Van Vliet

Priority:

Technical Review Branch: ORAB

Statement of Problem:

Design deficiencies have been identified in the BWR RPS MG set regulatory systems that could adversely affect the operability of the RPS if (1) a sequence of undetected single component failures were to occur or (2) a seismic event occurred that resulted in the postulated component malfunctions.

Background:

The design deficiency was first identified during the Hatch 2 licensing process. By letter dated August 7, 1978 the other BWRs were directed to review their designs and submit a report. That letter also directed that a surveillance program be implemented. By letter dated September 24, 1980 the licensees were requested to: (1) commit to installing a Class 1E system, (2) provide a schedule for completion of the modification, and (3) provide a schedule for submitting design information and proposed Technical Specifications. All licensees responded satisfactorily.

Current Status

LLNL is writing TERs based on licensee submittals. ORAB is writing SERs. Vendor delays in delivering monitoring packages have forced three licensees to defer the modification until FY 84. Other deferrals may be necessary. Ten SERs will be issued in FY 82 and seven in FY 83. No unresolved technical issues exist for this item.

Actions Required to Complete the MPA:

1. Review licensee's designs (post-implementation)
2. Review licensee's proposed TS changes
3. Issue license amendment that revises TS

Status Updated: April 16, 1982

Multi-Plant Action No. C-12

Title: Boron Solubility During Long Term Cooling Following LOCA

Lead Project Manager: Tim Colburn

Priority: Medium

Technical Review Branch(es): RSB

Problem:
Review of the Emergency Core Coolign System (ECCS) predicted performance has lead to concerns, for most PWRs designed by Combustion Engineering, regarding the suitability of systems available to prevent boron precipitation during long term cooling following a LOCA. Boron concentrations above the solubility limit would result in precipitation of boron, thus blocking the Reactor Pressure Vessel flow channels and thereby limiting ECCS flow.

Background:
The results of the above review were transmitted to the affected licensees by letters dated 9/7/77 (Palisades), 9/19/77 (Ft. Calhoun and Millstone 2), and 9/27/77 (St. Lucie 1 and Calvert Cliffs 1 and 2). Initial responses were received and a clarification meeting of the NRC staff with the licensees was held on 11/29/77. Additional licensee responses were received as requested during the meeting.

Current Status:
Calvert Cliffs 1 and 2 have addressed this problem in their Technical Specifications to the satisfaction of the ORPM. The OPRM feels licensing action is complete for these units as of 6/16/81. The action for Fort Calhoun is complete as of 3/10/81 with the issuance of an SER to that licensee. Millstone 2 has addressed this problem by establishing procedures for hot leg low pressure safety injection. An evaluation of the adequacy of Millstone 2's procedures in addressing the staff's concerns was transmitted to the licensee by letter dated 6/29/81. The submittal for St. Lucie 1 was evaluated and found acceptable by the staff as per our 3/29/82 letter. The other licensee has completed his response to our generic letter and is awaiting evaluation.

Action(s) Required to Complete the Licensing Action:

1. Approval of the remaining licensing submittal by DSI, specifically RSB.
2. Issuance of Ser to DL for transmittal to licensees by the Project Manager.
3. For those plants not approved (if any) request for additional information or request for Technical Specification change, as appropriate.

Status Updated 4/15/82

Multi-plant Action Number: C-14

Title: SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS

Lead Project Manager: J.T. Beard

Priority: 1

Technical Review Branch(es): ORAB

Statement of Problem

Since TMI-2, great attention has been focused on the ability of PWR's to reliably provide for shutdown decay heat removal at normal system pressure. The steam generator is the preferred and proven choice for accomplishing a safe shutdown of the plant. Therefore, the auxiliary feedwater systems (AFW) should satisfy the seismic design criteria for the Safe Shutdown Earthquake (SSE), consistent with other safety-related systems in the plant. However, only those facilities licensed recently have been reviewed against the NRC Standard Review Plan which treats the AFW as an Engineered Safety Feature.

Background

In August 1980, the NRC completed a preliminary study of the risk of a seismically induced loss of decay heat removal for plants without a seismically qualified AFW. One of the conclusions was that the increase in risk during the next three years is sufficiently small to allow plant operations to continue. Another conclusion was that plants should be surveyed to confirm the extent of the PWR plants without seismically qualified AFW.

In February 1981, the NRC developed and embarked on Multi-plant Action Plan C-14, "Seismic Qualification of Auxiliary Feedwater Systems." An objective to this plan is to increase, to the extent practicable, the capability of those plants without seismically qualified AFW to withstand earthquakes up to the SSE level. This multi-plant plan is described in an NRC memorandum to H. Denton dated February 20, 1981. The first phase is: (1) to identify, via a walkdown of the AFW system, deficiencies ammenable to simple remedial actions, and (2) to survey the plants to determine the extent and areas where significant improvements may be needed. The second phase is to have licensees complete re-analysis and/or significant modifications, for those plants which cannot demonstrate reasonable assurance of the functioning of the AFW system following an earthquake of SSE magnitude. After phase one, the NRC will complete certain decision-making processes and to take action to require licensees to make improvements.

Current Status

In a Generic Letter (GL 81-14), dated February 10, 1981, the NRC requested under 10 CFR 50.54(f) that all operating PWR licensees complete AFW walkdowns and report information regarding the seismic capability of AFW. This action implemented the first phase of the C-14 program.

Lawrence Livermore National Laboratory under technical assistance contract FIN A-0414 is reviewing and evaluating the licensees' responses to GL 81-14. Of the 47 PWRs involved with this MPA, LLNL has found it necessary so far to generate Requests for Additional Information for 44 plants, in order to correct deficiencies in licensees' responses or to obtain technical clarification of the licensees' responses.

In FY81, 2 TACS were completed. To date in FY82, 10 TACS have been completed, in that these plants have AFW designs that do not warrant further attention under this MPA program.

Actions Required to Complete the MPA

Thirty-five plant TACS remain active. LLNL is reviewing licensees' responses to Requests for Additional Information. The objective is to verify that AFW system walk downs were conducted and deficiencies identified, to report the level of seismic qualification of each area of the AFW, and to identify plants for which significant re-analysis and/or modifications may be needed. The results of this evaluation are to be reported both on a per plant basis and in a summary form for all the plants involved.

It is anticipated that LLNL can complete this effort (Phase I of the MPA) about the end of FY82.

Status Update

April 6, 1982.

Multi-Plant Action No.: D-01

No. of Plants: 22

Title: Mark I Containment Program

Priority:

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: D. Vassallo

Lead Engineer: B. Siegel

Lead Technical Review Branch: None - Work to be performed under Technical Assistance Contract

Other Review Branches: ORAB & Chris Grimes

Problem:

Since the original design of the Mark I containment system additional loading conditions resulting from the dynamic effects of drywell air and steam being rapidly furled into the suppression pool during a postulated LOCA and from suppression pool response to SRV operation generally associated plant transient operating conditions have been identified, the objective of this program is to restore the originally intended design safety margins for each Mark I containment system.

Background:

A Mark I Owners Group (OG) with GE the lead technical organization was formed to quantify the hydrodynamic loads and assess the effects of these loads on the Mark I containment structure. The OG divided this task into a short term (STP) and long term program (LTP).

The objectives of the STP were to verify that each Mark I containment system would maintain its integrity and functional capapability when subjected to the most probable loads induced by a postulated design-basis LOCA, and to verify that licensed Mark I BWR facilities would continue to operate safety, without endangering the health and safety of the public, while a methodical, comprehensive LTP was being conducted. The staff in the "Mark I Containment Short-Term Program Safety Evaluation Report," NUREG-0408 concluded that sufficient margin of safety had been demonstrated to assure the functional performance of the containment system and, therefore, any undue risk to the health and safety of the public was precluded.

The objectives of the LTP were to establish design-basis loads that are appropriate for the anticipated life of each Mark I BWR facility (40 years), and to restore the originally intended design-safety margins for each Mark I containment system. The principle thrust of this program has been the development of generic methods for the definition of suppression pool hydrodynamic loading events and the associated structural assessment techniques for the Mark I configuration. The generic anslysis techniques are intended to be

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modified by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review.

Actions Required to Complete the Licensing Action:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: 4/16/82

Multiplant Action Number D-04

Title PWR Reactor Vessel Cavity Seal Ring Missile Potential.

Lead Project Manager Charles Trammell

Priority 2

Technical Review Branch(es) ORB #3

Statement of Problem:

The reactor vessel cavity seal ring can become a missile if left in place during operation should a LOCA occur in or near the reactor vessel cavity.

Background:

Trojan disclosed this as a possible problem via an LER. On 2/2/78, letters were sent to all PWR licensees requesting a solution by either (a) removing the seal ring during operation or (b) confirming by analysis that the seal ring can withstand blowdown forces.

Current Status:

38 plants-completed.

4 plants-remain to be completed:

Haddam Neck

San Onofre 1

Surry 1

Surry 2

The remaining 4 plants have submitted "leak-before-break" analyses in response to MPA D-10, "Asymmetric LOCA Loads." It is expected that NRC will accept this analysis. If so, this will also solve D-4 for these plants, since the seal ring will not become a missile under "leak" conditions.

Actions Required to Complete the MPA:

The resolution of the 4 remaining plants (identified above) is dependent on the resolution of D-10 as described above.

Status Updated:

April 16,1982

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modified by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review.

Actions Required to Complete the MPA:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: April 16, 1982

Multi-Plant Action No. D-05
Title: Plant UPI Model Problem
Lead Project Manager: Robert B. A. Licciardo
Priority: 3
Technical Review Branch: RSB

Statement of Problem:

Only 2 loop PWR's are affected. All Westinghouse (W) 2 loop plants have a Low Pressure Safety Injection System (LPSI) which injects water directly into the Upper Plenum of the Reactor Vessel (UPI). This is used to counter the consequences of a single failure for 2 loop units.

However, the currently approved ECCS evaluation models for two loop plants are based on an ECCS system in which LPSI is directly to the cold leg of the Reactor Coolant System and because of this may be considered as not meeting the requirements of 10 CFR Appendix K Section II.5.

Background:

This has been an outstanding issue for two loop plants since the implementation of Regulations for an approved ECCS system. The issue became a MPA during late 1977 and 1978 when an "interim" model was developed to review the potential effect of UPI against the conventional model.

Current Status:

Six facilities are affected. W 2 loop UPI plants are presently operating on the bases of a number of approaches being taken to determine allowable peaking coefficients in an interim manner.

Acceptable long term resolution involves development of satisfactory generic models with plant specific application. Both W and Exxon fuels are involved.

Contractors are to be involved in the review of proposed models to develop acceptable generic resolutions (1982).

Plant specific applications are proposed for fiscal year 1983.

The Lead Project Manager has reviewed the history and current status of this item, and has made recommendations on future action to expedite completion.

Action(s) Required to Complete the MPA:

Review of Lead Project Managers proposal with RSB and NRR management to develop a mutually acceptable "modus operandi."

A proposal has been made by NRC (R. S. B.) to undertake at least two experiments in the Cylindrical Core Test Facility (CCTF) available in Japan to improve validation of current approaches.

Status Updated: April 16, 1982

Multiplant Action Number: D-10

Title: Asymmetric LOCA Loads on Primary Reactor Coolant System

Lead Project Manager: J. Shea

Priority: Medium

Technical Review Branch(es): MEB, MTEB, CPB, CSB

Statement of Problem:

Asymmetric loads resulting from rupture of the primary piping could potentially damage reactor vessel support internals and other primary system components. Damage to the reactor internals could impair core coolability.

Background:

In January 1978, all pressurized water reactor (PWR) licensees were required by the NRC to provide an assessment of the adequacy of their reactor vessel supports and other affected structures to withstand combinations of responses to asymmetric loss-of-coolant accident (LOCA) loads and the Safe Shutdown Earthquake (SSE). This potential safety problem was subsequently identified as an unresolved safety issue Task Action Plan A-2.

Current Status:

All PWR plant assessments for asymmetric loads have been received and are currently being evaluated by staff and contractor EG&G. As a basis for this evaluation, staff is implementing criteria developed as part of the Task Action Plan A-2. These criteria are included in NUREG-0609. Concurrently, some PWR licensees have performed a study of "leak before break". Staff approval of the "leak before break" concept is expected in April 1982.

Action Required to Complete the Licensing Action:

Complete evaluation of Owners Group submittals including Westinghouse Owners Group proposed "leak before break" concept and plant specific submittals and issue SER.

Status Updated: April 13, 1982

Multiplant Action Number: D-12

Title: BWR Non Jet Pump Core Spray Performance

Lead Project Manager: P. J. Polk

Priority: 3

Technical Review Branch: ORAB

Statement of Problem:

Core Spray System nozzle coverage differs in a steam environment vis-a-vis an atmospheric environment. The original design is based on atmospheric analyses and tests. The generic issue requires that nozzle coverage be reanalyzed to reflect the steam environment.

Background:

History is inappropriate since only one plant remains outstanding.

Current Status:

All non-Jet Pump BWRs have either made the necessary modifications or committed to same with the exception of Nine Mile Point.

1) Acceptance criteria to be used in resolving the issue; to be provided by ORAB
2) Important schedule considerations; None (low Priority)
3) Where more than one review branch is involved, responsible branches with a breakdown of each branch's responsibilities; (ORAB Only)
4) Identification and role of contractors; None

Actions Required to Complete the MPA:

Review and approval of both the Oyster Creek and Nine Mile Plants is necessary to complete this generic activity.

Status Updated: April 16, 1982

Multi-Plant Action No. D-15

No. of Plants: 70

Title: High Energy Line Break and Consequential System Failure

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch EQB, RRAB, GIB

Other Review Branches:

Problem: Certain non-safety grade equipment, if subjected to an adverse environment, could impact the safety analyses and the adequacy of the protective functions performed by safety grade equipment. The NRC is concerned that a potential may exist at operating light water reactor facilities, for an unreviewed safety matter related to the effects of the environment on control systems resulting from high energy line breaks inside or outside containment and the results of these effects on the required safety systems.

Background:
On September 17, 1979, the NRC requested that all LWR licensees review their plants to determine whether control system failures caused by high energy line breaks (HELB) could result in consequences more severe than previously analyzed for the HELB. All licensees responded in a timely manner (20 days). A status reported from D. G. Eisenhut to H. Denton dated October 15. 1979 provided a basis for continuing operation. A meeting with representatives of the nuclear industry was held on November 9, 1979. A status report P. S. Check to D. G. Eisenhut dated December 19, 1979 stated that the NRC task group had found no specific identified safety problems. There were remaining concerns which fall within the scope of NUREG-0660 II.C.3.

Current Status:

All TAC's issued on this subject are still open. A memo is in concurrence which includes instructions to PM's to close the issue and sent a letter to each utility informing them that any continuing effort by the staff will be under NUREG-0660 II.C.3.

Actions Required to Complete the MPA:

The above memo needs the concurrence of the AD/T DST who is responsible for the review. Following this each PM would receive the above instructions.

Status Updated: 4/16/82

Multiplant Action No.: D-16

Title: Review of Corporate Management Capability

Lead Project Manager: Sydney Miner

Priority: Low

Technical Review Branch(es): Licensing Qualification Branch

Statement of Problem:

To develop criteria and review for conformance to the criteria for onsite and offsite organizations, both management and technical, that will assure the safe operation of the plants during normal and abnormal conditions and the capability necessary to respond to accident situations.

Background:

In a letter dated June 29, 1979, shortly after the TMI-2 accident, we requested all power reactor licensees to supply information on their specific management and technical resources.

Upon review of the licensees' responses, we sent a second letter in February of 1980 stating that additional information is necessary to complete the evaluation. We also informed the licensees at that time that an outside contractor (Technicron Research, Inc.) in assisting the NRC in developing criteria, would contact them and request the information concerning their utility. Technicron reviewed the responses and the results of their effort were published in NUREG/CR-1656.

Subsequently, the Licensee Qualification Branch (LQB) developed guidelines and published them in NUREG-0731. The LQB are currently re-evaluating these guidelines.

Current Status:

The LQB is currently developing acceptance criteria for Corporate Management Capability and has let a contract to Pacific Northwest for the work. The Pacific Northwest effort is expected to be completed about the end of this calendar year. There are no licensing actions scheduled to be completed this year.

Action(s) Required to Complete MPA:

1. Issuance of guidelines by LQB.
2. Issuance of requirements by NRR to all operating plants.
3. Review of licensees' responses.
4. Issuance of a Safety Evaluation Report.

Status Update: 4/16/82

Multiplant Action No.: D-17

Title: Definition of Operable

Lead Project Manager: Sydney Miner

Priority Medium

Technical Review Branch(es): None

Statement of Problem:

Clarification of the term "OPERABLE" as it applies to support system outages or multiple outages of redundant components.

Background:

In a letter dated April 10, 1980, an explanation of the problem plus accompanying illustrate examples of recommended changes contained in the associated bases, were delineated to all licensees. The licensees were required to submit proposed changes to tech specs applicable to their plant and to implement procedures designed to assure compliance with the specifications containing new requirements.

Current Status:

1. Acceptance Criteria
   The acceptance criteria that LCO should be incorporated in the Technical Specification which requires that the plants be in cold shutdown within 36 to 39 hours if redundant ECCS loops become inoperable either due to failures in redundant ECCS loops or the diesel generators.

2. Important Schedule Considerations
   No licensing actions are scheduled to be completed this year.

3. Review Responsibilities
   This MPA is being handled completely within the Project Management Organization.

Actions Required to Complete MPA:

1. Remaining Milestones

   (a) Approval of remaining changes to the Technical Specifications of the remaining plants.

   (b) Issuance of the SER and the License Amendments.

2. Plant Actions Remaining

   There are 17 remaining licensing actions.

Status Updated: 4/16/82

Multiplant Action Number: E-04

Title: BWR Single Loop Operation

Lead Project Manager: Dick Clark

Priority: Low

Technical Review Branches: RSB, CPB

Statement of Problem:

The standard BWR Technical Specifications do not permit a plant with two recirculation loops to operate either with one loop or in the natural circulation mode. Thirteen operating BWRs have requested approval to operate at reduced power levels with a single loop if problems develop with a jet pump, valve, seals, flow controller, etc., in the other loop. Most of the potential safety reviews can more appropriately be resolved on a generic basis.

Background:

Single loop operation at limited power levels had previously been authorized for 6 BWRs for short periods of time (one week to two months). Based on this operating experience, the staff has concluded that BWRs can be safely operated at least 50% power by natural circulation (i.e., without forced flow from any recirculation loop). Accordingly, as an interim measure, for those licensees who modified their application, the plants have been authorized to operate, if necessary, at power levels of 50% with a single recirculation loop. For operation above 60% power, there is a generic concern involving flow stability when operating with one rather than two recirculation loops.

Current Status:

A meeting was held October 22, 1981 with all BWR licensees and GE to discuss GE's evaluation of Browns Ferry's and other BWR operating experience with single loop operation. RSB and CPB have prepared a draft list of questions which we discussed in a meeting with GE on January 21, 1982.

Actions Required to Complete the Licensing Action:

Transmit requests for additional information to licensees. Review and evaluate responses. Prepare safety evaluations authorizing plants to operate on a single loop at power levels indicated by the revised ECCS analysis.

Status Updated: April 16, 1982

Multi-Plant Action No. E-05
No. of Plants: 3
Title: Westinghouse N-1 Loop Operation
Priority: Low
Cognizant Assistant Director: T. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: L. Olshan
Lead Technical Review Branch: RSB
Other Review Branches: ICSB

Problem:

All Westinghouse plants have a provision in their license that prohibits operation with less than all loops (N) in service.

Background:

It may be desirable to operate plants with one loop out of service. Present restrictions in the license do not permit this type of operation.

Current Status:

Only three Westinghouse plants, Beaver Valley and Zion (1 and 2), have submitted proposed amendments for N-1 loop operation. Beaver Valley is lead plant and most of the review has been completed.

Action(s) Required to Complete the Licensing Action:

NRC to review contractor (Franklin Inst., Lawrence Livermore) inputs and write SER on Beaver Valley. Zion review to follow. Other Westinghouse pLants will probably submit similar applications if Beaver Valley is approved.

Multiplant Action Number E-06

Title CEA Position indication

Lead Project Manager Monte Conner

Priority 2

Technical Review Branch(es) ICSB

Statement of Problem:

Should we allow the use of the fully inserted or withdrawn reed switches for TS position indications.

Background:

Several licensees with CE designed NSSS requested substitution of fully inserted or withdrawn reed switches for either one of the two other CEA position indication systems required by the STS for reactor startup or change of mode.

Current Status:

By memo dated January 5, 1982, ICSB notified DL that the proposed Millstone 2 TS were unacceptable. No substantial justificaton was provided, however acceptable TS were enclosed. These TS are nearly indentical to the current Calvert Cliffs TS except for one paragraph that allows use of mimic lights to substitute for reed switch position indication.

Actions Required to Complete the MPA:

1. Prepare SE and issue proposed TS to Millstone-2. Such an amendment has been issued for Calvert Cliffs 1 and 2.
2. Issue letters to other CE units informing them of new acceptable T.S.

Status Update

April 15, 1982

Multiplant Action Number E-07

Title Reactor Protection System Logic for CE Facilities

Lead Project Manager Monte Conner

Priority Completed

Technical Review Branch(es) ICSB

Statement of Problem:

A TS discrepency exists in the length of time the fourth RPS channel may be bypassed at CE designed facilities.

Background:

In the Calvert Cliffs and St. Lucie STS, the RPS is controlled as a 2-out-of-4 logic system. However, the same RPS is operated as a 2-out-of-3 logic system witn an installed spare in accordance with the Millstone-2 STS and the Ft. Calhoun, Maine Yankee and Palisade custom TS.

Current Status:

ICSB prepared a memo to provide our justification for requiring the above licensees to accept the 48 hour bypass TS. This memo also provides criteria for longer bypass based on system separation and related requirements. Letters were issued to the involved licensees on March 31, 1982.

Actions Required to Complete the MPA:

Closed as MPA; any resultant TS changes to be handled on plant-specific basis.

Status Updated

OPERATING REACTORS LICENSING ACTIONS SUMMARY

Manuscript Completed: May 1982
Date Published: May 1982

Prepared for: OFFICE OF NUCLEAR REACTOR REGULATION

Prepared by: OFFICE OF RESOURCE MANAGEMENT
U.S. NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555

FOREWORD

THE OPERATING REACTORS LICENSING ACTIONS SUMMARY IS DESIGNED TO PROVIDE THE MANAGEMENT OF THE NUCLEAR REGULATORY COMMISSION (NRC) WITH AN OVERVIEW OF LICENSING ACTIONS DEALING WITH OPERATING POWER AND NONPOWER REACTORS. THESE REPORTS UTILIZE DATA COLLECTED FROM THE DIVISION OF LICENSING IN THE OFFICE OF NUCLEAR REACTOR REGULATION AND ARE PREPARED BY THE OFFICE OF MANAGEMENT AND PROGRAM ANALYSIS.

THIS SUMMARY REPORT IS PUBLISHED PRIMARILY FOR INTERNAL NRC USE IN MANAGING THE OPERATING REACTORS LICENSING ACTIONS PROGRAM. ITS CONTENT WILL CHANGE BASED ON NRC MANAGEMENT INFORMATIONAL REQUIREMENTS.

TABLE OF CONTENTS

Definitions I-III

Section 1 Management Overview Report

A. Plot of Total Active Routine Actions by Month A1

B. Plot of New Actions by Month B1

C. Plot of Completed Actions by Month C1

D. Routine Licensing Actions by Month D1-D2

E. Routine Licensing Actions - Power Reactors E1-E3

F. Routine Licensing Actions - Nonpower Reactors F1-F2

G. Manpower Summary by Facility G1-G3

H. Multi-Plant Issues Summary Report H1-H4

I. Multiplant Actions - Lead Assignments and Contract Information I1-I12

J. Operating Reactors Hearing Summary J1-J5

K. Completed Licensing Actions by Fee Class K1

L. FY to Date Multi-Plant Specific Action Summary L1

M. Multiplant Action Completion Schedule M1-M18

N. USI Implementation Status N1-N3

Section 2 TMI Licensing Actions

A. Plot of Total Active TMI Actions by Month A1

B. Plot of New TMI Actions by Month B1

C. Plot of Completed TMI Actions by Month C1
D. TMI Licensing Actions by Month D1-D2
E. TMI Power Reactors Licensing Actions E1-E3
F. Status of NUREG-0737 Requirements Schedule F1-F13

Section 3 Licensing Action by Power Reactor Condensed Management Report 1-167

Section 4 Multiplant Action Descriptions for Active Issues

Definitions

I. Licensing Actions

A. Active Licensing Action - an item which has been initiated but not completed.

1. Multi-Plant Licensing Action - a licensing action topic that applies to a class of reactors.

2. Plant Specific Licensing Action - a licensing action associated with a certain facility because of the uniqueness of the technical specifications or situation, e.g., reduce the number of incore detectors.

B. Types of Licensing Actions

1. Amendment - action that results in changes to facility licenses including technical specification changes.

2. Letters to Licensees - letters sent to licensee requesting information that will resolve or aid in the resolution of technical issues. Examples of letters sent to licensees are: fuel handling inside containment, assymmetric loads or reactor vessel materials surveillance.

3. Orders/Exemptions - actions on operating plant that result in an Order for Modification of a License or an exemption to the regulation.

C. Categories of Multiplant Actions

1. Regulation - actions directly attributed to a specific regulation requirements, e.g., inservice inspection/testing requirements 10 CFR 50.55a(g).(A-Series)

2. Operating Experience - action directly attributed to an occurrence of accumulative experience at licensed reactors e.g., fire protection. (B-Series)

3. Internal Review - action resulting from NRC staff reviews of license applications, generic topics and operating reactor licensing actions, e.g., reporting requirements, fuel handling accidents, or filter tech spec requirements. (C-Series)

4. New Information - action required as a result of current data which shows that previously accepted requirements are no longer acceptable or are overly restrictive, e.g., ECCS input errors, assymmetric loads, equipment qualification. This new information may result from technological advancements, research or advanced analytical studies. (D-Series)
5. Licensee Requests - action requested by the licensee that does not fit any of the other sources of licensing actions. Usually these actions are requested because of the licensee's desire to improve operational performance, e.g., core reloads, spent fuel pool modifications, or (N-1) loop operation. (E-Series)
6. TMI Related Actions - actions related to the TMI Action Plan. (F-Series)

II. Significant Dates

A. Initiation - This is the date an action was actually started or implementation was begun on a plant. It is the date that a letter was issued to the licensee initiating the action, the date of an amendment request, or the date a TAC was issued for an item arising out of an operating experience or new information event.

B. PM-Target - project manater's anticipated completion date for active items.

C. Licensing Action Complete - date on which all work, both technical and administrative was completed and sent out of the agency.

III. Definition of Priorities (Applicable to Multi-Plants or Plant Specific Actions)

A. High (1)

1. Required by Rule, Order or NRC Letter
2. Safety-related items that use definite improvements in safety or would reduce the likelihood of transients or accidents.
3. Hearing-related matters.
4. High public interest in issue.
5. Actions which, if not completed, will affect power level or scheduled restart of a facility.
6. § 2.206 petitions.

B. Medium (2)

1. Items which, if not completed could result in an otherwise unnecessary IE enforcement action.
2. Spent fuel pool expansions.
3. Task should be completed within six months.

C. Low (3)

1. Licensee requests for amendments that have low safety significance.
2. Licensee requests for amendments which may have safety significance but for which NRC action is not required during the next six months (e.g., in early submittal of a core reload).

OPERATING REACTORS HEARING SUMMARY

Status as of April 19, 1982

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Big Rock Point	R. Emch	M. Karman	Mixed Oxide Fuel	8/75	In indefinite suspension as a result of GESMO decision.
Big Rock Point	R. Emch	J. Moore	Spent Fuel Pool Expansion	9/25/79	Evidentiary hearing currently scheduled for 6/7/82
Browns Ferry 1/2/3	R. Clark	R. Rawson	Onsite Storage of Low Level Waste	1/81	ASLB denied petitions to intervene. Appeal Board remanded issue back to ASLB and reinstated intervenors. Staff and TVA has appealed decision to the Commission. The Commission ordered briefs to be filed by the staff and TVA by May 6, 1982. Staff evaluations due to ASLB by May 1, 1982. Prehearing conference held April 1, 1982 in Huntsville, AL.
Dresden 1	P. O'Connor	R. Rawson	Decontamination	9/30/81	First Prehearing Conference has not yet been held. Contentions remain pending.
Dresden 2/3	P. O'Connor	R. Goddard	Spent Fuel Pool Expansion	9/21/78	An initial Decision has been issued by the ASLB (5 out of 33 racks for Unit 3 only) permitting partial re-racking pending resolution of seismic questions.
Dresden/Quad Cities	R. Bevan	R. Goddard	Shipment of Spent Fuel	8/22/78	Special prehearing conference held February 1, 1979. Hearing not yet scheduled.
GETR	C. Nelson	D. Swanson	Seismic Show Cause Issues	10/24/77	Testimony completed; awaiting Initial Decision.
Ginna	J. Lyons	M. Young	Full Term Operating License Conversion	6/8/73	Litigation is being held in abeyance until completion of SEP.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Humboldt Bay	V. Rooney	M. Young	Deletion of Seismic Conditions	7/29/77	Motion to withdraw application for license amendment and to terminate the proceeding filed by the licensee on December 31, 1980. By memorandum and order dated February 17, 1982 the ASLB ordered the licensee to file status reports each 3 months. The ASLB also ordered that 6 months after the Commission reaches a decision on safety goals and issues guidelines the licensee must report to the Board a) readiness to take actions to permit resumed operation, or b) commit to submit a decommissioning plan.
LaCrosse	R. Dudley	C. Woodhead	Full Term Operating License (with seismic considerations)	6/23/78	Motion for summary disposition of environmental contentions is pending before ASLB. The proceeding has recommenced following consolidation of seismic issue from Show Cause (2.206) proceeding with FTOL proceeding. The FTOL proceeding is contingent upon the completion of the SEP for the facility.
Maine Yankee	C. Nelson	J. Gutierrez	Spent Fuel Pool Capacity Expansion	9/18/79	First Prehearing Conference completed. Two intervenors admitted. April 12, 1982 ASLB Order admits 14 contentions.
North Anna 1/2	L. Engle	D. Swanson	Turbine Missile Risk	2/27/78	Testimony completed; awaiting ASLAB to close or reopen hearing. In a letter dated 2/26/82 to the licensee, the ASLAP stated that it had concluded that there is no necessity for an additional evidentiary hearing regarding turbine missiles. It is now assumed the issue will be decided by the Board on the record as it now stands.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Palisades	T. Wambach	C. Barth	Steam Generator Repair Program	7/23/79	Staff is awaiting licensee's decision to proceed with the repair program. Therefore, litigating efforts are being held in abeyance.
Point Beach 1/2	T. Colburn	R. Bachman E. Shomaker	Determination on Proprietary Nature of Westinghouse Documents Related to Steam Generator Tube Sleeving	7/20/81	Testimony in progress. Discovery complete. Parties now responding to Board questions. No decision on hearing date.
Point Beach 1/2	T. Colburn	R. Bachman	Steam Generator Tube Sleeving	7/20/81	Testimony in progress. Parties have filed motions to compel responses to discovery. Hearing date decision dependent on issuance of staff SER and EIA.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Quad Cities	R. Bevan	R. Goddard	Spent Fuel Pool Expansion	4/30/81	Petitions for leave to intervene have been filed. Prehearing Conference held on October 14, 1981. Prior to hearing scheduled for May 11, 1982, intervenors withdrew contentions and request for hearing. Board expected to issue order terminating Hearing.
Rancho Seco	M. Padovan	R. Black	Commission Order of May 7, 1971, related to TMI Related Modifications.	5/15/79	Initial Decision of ASLB under review by ASLAB sua sponte.
Salem 1	W. Ross	B. Smith	Spent Fuel Pool Modifications	3/7/78	Initial Decision issued October 27, 1980 authorizing amendment; affirmed by ASLAB on July 17, 1981 (ALAB-650). Commission declined review on November 9, 1980). Appeal has been filed before 3rd. Circuit Court of Appeals.
Three Mile Island 1	R. Jacobs	J. Gray J. Cutchin J. Goldberg	TMI-1 Restart	8/79	Initial Decision issued; before the Commission for determination of immediate effectiveness. (ASLB decision on issues related to cheating incident is not yet issued.)

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Palisades	T. Wambach	S. Burns	Plant Operator's Union Opposition to Overtime Limits Imposed on Licensee by IE Order Related to TMI Requirements.	3/9/81	Request for hearing denied by ASLB. On March 31, 1982 the ASLAB reversed the decision by the ASLB and remanded the case for further proceedings.
Robinson 2	G. Requa	S. Treby	Radon	11/30/73	Partial Initial Decision issued by ASLB; affirmed by ALAB on October 31, 1979 (ALAB-569). Pending before ASLAB on radon only.

Notes:

/1 Orders were issued January 13, 1981, requiring modifications and report submittals.

/2 Orders were issued October 24, 1980, requiring submission of reports.

/3 All SERs contained open items requiring further submittals from licensees.

/4 Resolution resulted in a revised Section 5.4.7 of the Standard Review Plan in lieu of a formal report. A generic letter on this subject will be issued in the future.

/5 A rulemaking proceeding is currently in progress. No further plant specific licensing action will occur pending completion of rulemaking.

LICENSING ACTIONS BY POWER REACTOR CONDENSED MANAGEMENT REPORT

DATA AS OF - 04/30/82

CONDENSED MANAGEMENT REPORT

FACILITY: ARKANSAS 1

PLANT LOCATION: 6 MI WNW OF RUSSELLVILLE, AR
DOCKET NUMBER: 050-00313
ARCH/ENGINEER: BECH
IE INSPECTOR: W. JOHNSON

LICENSED POWER: 2568 MWT
DESIGN POWER: 0850 MWE
NSSS VENDOR: B&W

PROJECT MANAGER: G. VISSING
BRANCH CHIEF: J. STOLZ
LIC. ASSISTANT: R. INGRAM

MULTI-PLANT

TAC #	TAC DESCRIPTION	PRIORITY	CRITICAL DATE
COMPLETED ACTIONS			COMPLETE
43548	ANO 1 - EMERG PROCEDURES & TRAINING FOR STATION BLACKOUT EVENT	1	12/11/81
43886	ARKANSAS UNIT 1 - STATION BLACKOUT PROCEDURES & TRAINING		12/11/81
46810	ANO 1 - QUAL. OF INSP., TEST, EXAM, AND AUDIT PERSONNEL		12/15/81
10537	ANO 1 - GUARD TRAINING PLAN REVIEW	1	02/23/82
10378	ANO 1 - LOSS OF 125 DC BUS VOLTAGE WITH LOSS OF ANNUNCIATOR SYSTEM	3	02/28/82
12790	ANO 1 - ADEQUACY OF ELECT. DIST SYSTEM	3	03/09/82
43549	ANO 1 - SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS	1	04/02/82
43265	ANO 1 - B&W ACCIDENT INDUCED NEUTRON FLUX ERRORS (MULTI-PLANT ITEM B-64)	3	04/11/82
10542	ANO 1 - VITAL AREA ANALYSIS	1	04/12/82
ACTIVE ACTIONS			TARGET
43554	ANO 1 - REASSESSMENT OF SEC. III.G, III.J & III.O OF APP.R	1	
43691	ANO 1 - REQUEST FOR EXEMPTION FROM MEETING SCHDULE OF 50.48	1	
07862	ANO 1 - PRESSURE VESSEL SUPPORT (ASYMMETRICAL LOADS)	2	12/30/81
07971	ARKANSAS 1 -CONTROL OF HEAVY LOADS OVER SPENT FUEL POOL (NUREG 0612)	2	01/30/82
42901	ANO 1 - MASONRY WALL DESIGN. RESPONSE TO IE BULLETIN 80-11	2	01/31/82
07087	ANO-1 TENDON SURVEILLANCE PROBLEMS	2	05/30/82
12320	ANO 1 - HELB AND CONSEQUENTIAL SYSTEM FAILURE ARKANSAS 1	3	05/31/82
11236	ANO 1 - REVISED IST - TESTING	1	06/30/82
06038	ANO 1 - PWR SECONDARY WATER CHEMISTRY MONITORING REQUIREMENTS - GENERIC	2	06/30/82
42514	ANO 1 - ENVIRONMENTAL QUALIFICATION OF SAFETY RELATED ELECTRICAL EQUIPMENT (80-CLI-21)	1	07/30/82
07521	ANO 1 - REVISED ISI	1	08/23/82
06806	ANO 1 - OVERPRESSURIZATION	2	09/30/82
42650	ANO 1 - IE BULLETIN 79-27, LOSS OF NON CLASS IE INST & CONTR. POWER. REV. & EVAL. RESPONSES	2	09/30/82
46597	ARKANSAS 1 - MONITORING OF FATIGUE TRANSIENT LIMITS FOR THE REACTOR COOLANT SYSTEM	3	09/30/82
47181	ARKANSAS 1 NATURAL CIRCULATION COOLDOWN (GENERIC LTR 81-21)	2	11/01/82
11266	ANO 1 - MECHANICAL SNUBBERS	2	01/01/83
11267	ANO 1 - HYDRAULIC SNUBBERS	3	01/01/83
46824	ARKANSAS 1 - PWR MSLB WITH CONTINUED FEEDWATER ADDITION	1	01/31/83
08105	ANO 1 - APPENDIX I TECH SPEC IMPLEMENTATION REVIEW	3	02/15/83
43632	ANO 1 - SEISMIC QUALIFICATION OF THE AUXILIARY FEEDWATER SYSTEM	1	08/30/83

CONDENSED MANAGEMENT REPORT

FACILITY: SURRY 1

PLANT LOCATION: 17 MI NW OF NEWPORT NEWS, VA
DOCKET NUMBER: 050-00280
ARCH/ENGINEER: S&W
IE INSPECTOR: D. BURKE

LICENSED POWER: 2441 MWT
DESIGN POWER: 0788 MWE
NSSS VENDOR: WEST

PROJECT MANAGER: D. NEIGHBORS
BRANCH CHIEF: S. VARGA
LIC. ASSISTANT: C. PARRISH

MULTI-PLANT

TAC #	TAC DESCRIPTION	PRIORITY	CRITICAL DATE

Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests is being reviewed by a contractor (SAI). After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant specific basis with a schedule keyed to inspection program update requirements.

Actions Requred to Complete the MPA:

Thirty-nine facilities remain to be reviewed in FY-82 in accordance with the attached schedule. Thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 1/25/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.
3. DL issue license amendment.

Status Updated: 4/16/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Lead Project Manager: W. Paulson

Priority: 1

Technical Review Branch(es): CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center is under contract for performing the review of the 47 remaining plants in this program. All (46) TERs have been received from Franklin Research Institute. No TER is exepcted for Dresden 1 which is on hold. Thirty-three SERs have been forwarded to DL by CSB; three of these need further work. Eighteen licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on 12 SERs in preparation for issuance. CSB needs to complete 10 SERs plus rework 3 SERs.

Status Updated: March 31, 1982

Multiplant Action Number A-10

Title Contingency Planning

Lead Project Manager E. McPeek

Priority High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

   a. 10 CFR Part 73, Appendix C
   b. Regulatory Guide 5.44
   c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (4) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-11

Title: Guard Training PLans

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

   a. 10 CFR Part 73, Appendix B
   b. NUREG-0674
   c. NUREG-0219
   d. NUREG-0576

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and ten (10) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued.
2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by ORPMs, MEB and a contractor (EG&G). After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements.

Actions Required to Complete the MPA:

Sixty-four facilities remain to be reviewed in FY-82 in accordance with the attached schedule. For the reviews being conducted by MTEB or the contractor, thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 1/25/82

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number A-15

Title Quality Assurance Request Regarding Diesel Generator Fuel Oil

Lead Project Manager G. S. Vissing

Priority Low (3)

Technical Review Branch(es) PM ORB#4

Statement of Problem:
Consumable items where quality is necessary for functional performance of safety related components should also be classified as safety related and thus subject to applicable provisions of Appendix B to 10 CFR 50. DG fuel oil should therefore, be on the Q list or included in the QA program.

Background:
At ANO-1 IE found that DG fuel oil was not on their Q list or in their QA program. On investigation, we found this to be the case in other plants as well. Therefore, in January 1980, we requested all licensees to check their QA programs with respect to DG fuel oil and to include DG fuel oil in their QA programs or provide justification for not doing so.

Current Status:
Issue is complete for all affected plants.

Actions Required to Complete the MPA:
None

Status Updated 4/15/82

Multi-Plant Action No. A-16

Title: Qualification of Inspection, Examination, Testing and Audit Personnel

Lead Project Manager: Dave H. Jaffe

Priority; I

Technical Review Branch: QAB

Statement of Problem:

Guidance for the qualification requirements for inspection, examination, testing, and audit personnel has been incorporated in Regulatory Guides 1.58, Revision 1, and 1.146. This guidance should be implemented in a uniform manner by all power reactor licensees.

Background:

On May 4, 1981 Generic Letter 81-01 was sent to power reactor licensees and CP holders to request commitments to comply with certain regulatory positions presented in the subject Regulatory Guides.

Current Status:

All ooperating reactor licensees have responded to Generic Letter 81-01 and these responses are under review in QAB against the criteria of Regulatory Guide 1. 146 and Positions C.5, 6, 7, 8, and 10 of Regulatory Guide 1.58, Revision 1. As of April 8, 1982, MPA-A-16 has been resolved for 49 of the 72 scheduled facility reviews.

Action(s) Required to Complete the Licensing Action:

A close out letter is to be sent to licensees who provided an acceptable commitment to Regulatory Guides 1.58, Revision 1, and 1.146. As of April 8, 1982 letters have been sent closing out 42 of the 72 scheduled reviews.

Status Updated April 15, 1982

Multiplant Action No: B-01

Title: Diesel Generator Lockout

Lead Project Manager: T. Wambach

Priority:

Technical Review Branch(es): ORAB

Problem:

Some failures-to-start of diesel generators have been attributed to diesel generator lock-out involving critical timing of control circuit relay operation or reset following manual shutdown of the diesel. IE has transferred responsibility to Licensing to determine whether similar circuitry problems exist at other facilities and what corrective measures should be implemented.

Background:

By memo dated 1/26/77, DOT has requested that a survey be made of all operating plants to determine whether lockout or diesel generator operability is specifically annunciated in the control room for each diesel generator. A letter was sent to all operating reactors in March 1977. Review of responses has been completed.

Current Status:

Of the 63 units, 59 have been completed. NRC technical position has been documented to DL by ORAB.

Action(s) Required to Complete the Licensing Action:

Forward position to licensees of 4 remaining units. Obtain licensee commitment to meet position and write final letter closing out.

Status Updated: January 26, 1982

Multiplant Action Number B-03

Title PWR Moderator Dilution

Lead Project Manager Chris Nelson

Priority Low

Technical Review Branch(es) ORB #3

Statement of Problem:

All PWR licensees are to review potential for moderator dilution and verify that FSAR Moderator Dilution Event is most Limiting.

Background:

NaOH was inadvertently injected into the RCS at Crystal River Unit 3 via the DHR system during surveillance cycling of the NaOH tank's isolation valves. This was a previously unanalyzed source of moderator dilutor.

Current Status:

- PWR license es are required to analyze RCS moderator dilution by the contents of the spray additive system or show that this is not a source of moderator dilution.
- PWR licensees are to verify that FSAR moderator dilution event is most limiting.
- Franklin Research Center performing review under NRC contract NRC-03-81-130.

Actions Required to complete the MPA:

- Salem 1 is the only plant left to be reviewed
- FRC Draft TER returned with comments April 6, 1982

Status Updated:

April 15, 1982

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:
All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; (c) Technical Specifications. Twelve plants remain for which licensing action is required. SERs are available for three of the plants with only PM processing required. The remaining nine plants are being reviewed by contract with EG&G for reactor system aspects through RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the nine plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 4/16/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1

Lead Project Manager: Dick Clark

Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operating licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. Initial responses were received from all but one licensee and from all near-term applicants for operating licenses.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions Required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. Since MTEB could not begin the reviews this fiscal year, the proposed action is to have the reviews performed by INEL/EG&G. A revised statement of work, including MPA B-05, was mailed to the contractor on March 8, 1982. INEL has submitted a revised 189 for DL approval. If approved, INEL anticipates the reviews could be initiated by May 15, 1982. A total of 23 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY 83.

Status Updated: April 16, 1982

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:
1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize hydraulic snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-17 actions.
3) A total of 24 actions have been completed to date:

Actions Required to Complete the MPA:
1) 21 actions have been completed to date for FY82.
2) 4 additional actions required to meet FY82 schedule.

Status Updated: 4/16/82

Multi-Plant Action No. B-22

No. of Plants: 66

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem:

OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize mechanical snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-22 actions.
3) A total of 34 Actions have been completed to date.

Actions Required to Complete the MPA:

1) 17 actions have been completed to date for FY82.
2) 8 additional actions required to meet FY82 schedule.

Status Updated: 4/16/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Lead Project Manager: R Dudley

Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1982. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

69 - operating plants covered by B-23
54 - SERs completed (7 of which have open items)
44 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 22 remaining SERs. Complete the 25 remaining licensing actions.

Status Updated: April 1, 1982.

Multi-Plant Action No B-24*
*B-20 integrated into B-24 on 8/25/80

No. of Plants: 66

Title: Venting and Purging Containment While at Full Power and Effect of LOCA

Priority: High

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: S. Varga

Lead Engineer: E. Reeves

Lead Technical Review Branch: CSB/DSI

Other Review Branches: EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980 and March 24, 1981 to all OL OR Branch Chiefs and Project Managers and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are managed by the Technical Review Team as follows:

   a. Electrical Reviews are managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews are managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements are managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews are managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB #1 (concurred in by CSB/DSI) was prepared for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review will complete TMI Item II.E.4.2, except for II.E.4.2.5 Containment Pressure Setpoint. However, CSB/DSI will provide SER's for II.E.4.2.6 and II.E.4.2.7 or will concur in SER's developed by Project Managers

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Project Managers should issue the update status of NRC reviews as soon as possible to each licensee using the sample letter (4 above). This is important to get the issue clearly understood by each PM and each licensee and to get the action completed. Lead PM records show that sixteen (16) plants have not been sent the status letter per the June 19, 1981 instructions. This letter should contain the staff guidance and any existing staff SER's received to date.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SER's and provide to Project Manager. Technical reviewers should also provide a status report to the Lead PM on TER's and SER's on a monthly basis.

3. Project Managers should review the licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

4. TMI Item II.E.4.2.5 reviews by CSB have been completed. SER's have been issued to licensees except for Crystal River 3 and Palisades. Project Managers should complete this action.

Status Update: 4/15/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking

Lead Project Manager: P. W. O'Connor

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Ten plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Eleven plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements.

Actions Required to Complete the MPA:

Complete the review of the deviations on the eleven remaining plants. Obtain commitments to follow NUREG-0619 guidance or issue orders requiring compliance if necessary.

Status Updated: January 26, 1982

Multi-Plant Action No. B-31
No. of Plants: 3
Title: Long Shaft LHSI and Outside Recirc Pump Degradation
Priority: Low
Cognizant Assistant Director: T. M. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Neighbors
Lead Technical Review Branch: EQB
Other Review Branches: ____________

Problem:

Upgrade pumps at plants which have long shaft pumps. There were five plants in this category.

Background:

Excessive degradation occurred to bearings and shaft after short periods of operation of these pumps. Problems originally occurred at North Anna.

Current Status:

Complete.

Action(s) Required to Complete the Licensing Action:

None.

Status Updated: 4/6/82

Multi-Plant Action No. B-32

No. of Plants: 5

Title: Blocked SI Signal During Cooldown

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch ORAB (contractor)

Other Review Branches:

Problem:

NRR/DOL was requested by IE to determine the acceptability of blocking the steam line differential pressure safety injection signal during cooldown simultaneously with the blocking of the coincident pressurizer low level and low pressure signal. All PWR's should be reviewed for the same problem.

Background:

During an inspection at H. B. Robinson 2, it was found that during cooldown the licensee blocks the safety injection initiation signal from the high differential pressure between steam lines and the steam line header. This block is hard-wired into the same switch that is used to block the pressurizer low pressure and low level safety injection signal when primary pressure is below 2000 psig. The technical specifications (Table 3.5-3) allow blocking the pressurizer signals but do not address the blocking of the steam line high differential pressure signal.

We have also determined that Surry 1 and 2 and Turkey Point 3 and 4 have the same instrument and signal blocking arrangement and technical specification requirements as H. B. Robinson 2.

Current Status:

Robinson 2 submitted an amendment request and the amendment has been issued. A contractor report has been transmitted to the lead PM.

Actions Required to Complete the MPA:

The contractor report indicated that there are a total of 18 facilities that appear to have the same arrangement (10 sites). The lead PM is working out a plan of action to take. New TACs will be issued.

Status Updated: 4/16/82

Multiplant Action Number B-36

Title RTD Response Time

Lead Project Manager Monte Conner

Priority 2

Technical Review Branch(es) ICSB

Statement of Problem:

To accurately determine the response time for RTD used in the RPS.

Background:

With the adaptation of the STS definition of RPS response time requirements for primary sensors, the RTD portion of the response time became a difficult value to obtain. If the RTD is removed from its well in the RCS piping, how do you account for the well effect in finding the response time? New methodologies are now available to measure RTD response times directly during reactor operations.

Current Status:

By letters issued about July 1, 1981, this MPA was closed for the Calvert Cliffs Arkansas-2, Palisades, Millstone-2, Maine Yankee and St. Lucie units It has recently been issued for Ft. Calhoun. In October, 1981, a closeout package, that would send NUREG-0809 to all B&W and W units, was prepared. The problems with its issuance have recently been resolved; and its awaiting D. G. Eisenhut's signature.

Actions Required to Complete the MAP:

Get above package issued to all B&W and W utilities.

Status Update:

April 15, 1982

Multiplant Action Number: B-41

Title: Fire Protection - Final Tech Specs - Final SER Supplements

Priority: High

Lead Project Manager: T. Wambach

Review Branches: CEB, ASB, PSB, ICSB, RSB, PTRB, LQB

Statement of Problem:

Protection of safe, shutdown capability from the adverse effects of fire in any area of the plant. During the OL review of plants licensed prior to July 1976, no in-depth review was performed in this area.

Background:

Fire at Browns Ferry Nuclear Plant in March 1975 disabled redundant safety divisions and normal safe shutdown equipment. NUREG-0050.

Current Status:

10 CFR 50.48 and Appendix R to 10 CFR 50 became effective February 17, 1981. The licensees for 71 units licensed prior to January 1, 1979 and for 3 units licensed after January 1, 1979 have made submittals describing (1) plans and schedules to meet Appendix R, (2) design descriptions of alternative, safe shutdown modifications, and (3) exemption requests from Appendix R.

Action(s) Required to Complete the Licensing Action:

The submittals described above for all 74 units must be reviewed and acted upon by June 1982. This will entail issuing exemptions, exemption denials and SERs approving alternative or dedicated safe shutdown modifications. Review of new OLs is now incorporated in the SRP. Final Tech Specs covering the equipment added as a result of Appendix R must also be issued after the modifications are complete.

Lead Engineer: W. J. Ross
Lead Technical Review Branch: Material Engineering
Other Review Branches: ____________________

Problem:

Monitor U. T. inspections of W and GE low pressure turbine discs for keyway cracks.

Background:

Inspections by W since 10/79 have revealed novel stress corrosion cracks in keyway and bore regions of low pressure turbine discs.

Current Status:

Staff action complete. Lead engineer monitoring W and GE activities.

Action(s) Required to Complete the Licensing Action:

None.

Status Update: 4/7/82

Multiplant Action Number: B-48

Title: Adequacy of Station Electric Distribution Voltage

Leak Project Manager: R. Dudley

Priority: 2

Technical Review Branch(es): PSB

Statement of Problem:

This review is intended to determine if the onsite distribution system in conjunction with the offsite power sources has sufficient capacity and capability to automatically start and operate all required safety loads within the equipment voltage rating.

Background:

At Arkansas Nuclear 1, loss of offsite power indicated that the electric distribution systems were inadequate for two unit operation. All utilities were asked to review their distribution systems to see if voltages were adequate.

Current Status:

71 - operating plants covered by B-23
42 - SER's completed (10 of which have open items)
26 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the remaining 39 SER's.
Complete the remaining 45 licensing actions.

Status Updated: APRIL 1, 1982

Multi-Plant Action No. B-49

No. of Plants: 17

Title: PWR Control Rod Misalignment

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch: ORPM - Lead Engineer

Other Review Branches: Core Performance Branch

Problem:

Older Westinghouse Plant's Technical Specifications did not provide requirements to ensure compliance with assumptions used in various analysis regarding control rod alignment.

Background:

Letters were sent to all Westinghouse PWRs on October 29 or November 5, 1979 requesting revisions to their TS (if needed) to ensure rods were aligned within 15 actual inches or 7.5 indicated inches.

Current Status:

1. License amendments issued on 14 plants.
2. Awaiting TS proposal on 2 plants (Surry 1 and 2).
3. Reviewing latest proposal from Kewaunee.

Action(s) Required to Complete the Licensing Action:

1. Review proposed TS from remaining plants when received.

2. Negotiate an ageeement with remaining plants.

Status updated: April 6, 1982

Multi-Plant Action No. B-57

No. of Plants: 44

Title: Decay Heat Removal Capability

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. DeAgazio

Lead Technical Review Branch None

Other Review Branches:

Problem:
To assure redundancy in decay heat removal capability by incorporation of requirements into the Technical Specification.

Background:

Various events at PWRs that have occurred during shutdown conditions have indicated that administrative controls to assure decay heat removal capability have been inadequate. All PWR licensees were requested (in a letter dated June 11, 1980) to incorporate requirements for redundancy into their TSs.

Current Status:

Acceptance criteria are: (1) redundancy in decay heat removal capability must be provided for all modes or temperature ranges of operation, particularly in Modes 4, 5 and 6, and (2) adequate surveillance requirements must be provided. A total of 16 plants remain to be reviewed. Indian Point 2 and 3 have not responded to our original request. Kewaunee, Crystal River 3 and Palisades responsed but did not propose new Technical Specifications because they believed that their current Technical Specifications are adequate.

INEL is reviewing submittals and identifying where the proposed TSs, in conjunction with existing TSs, do not conform with our Standard TSs.

Actions Remaining:
1) Review applicable sections of the Kewaunee, Crystal River 3 and Palisades Technical Specifications
2) Review TER's as they are completed. Decide whether deficiencies are serious enough to warrant additional requests to licensees. If not, issue the license amendment as requested.

Status Updated: 4/16/82

Multiplant Action No. B-58a

No. of Plants: All BWRs

Title: BWR Scram Discharge Volume Technical Specifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ORB#2

Statement of Problem:

Common cause failures of instrument volume level switches. Precursors at Hatch and Brunswick resulted in IE Bulletin 80-14.

Background:

Model Technical Specifications were sent to the industry by letter dated July 7, 1980. Submittals were subsequently received from the affected licensees and are being reviewed by the Franklin Research Center.

Current Status:

NRC contract NRC-03-81-130 has been issued to Franklin Research Center to review licensee submittals and write TERs. Final TERs for 15 plants have been received as of 4/15/82.

Action Required to Complete the MPA:

Issue license amendments upgrading TS after receipt of TERs.

Status updated: April 16, 1982

Multiplant Action No. B-58b

No. of Plants: All BWRs (except LACBWR) - 23

Title: BWR Scram Discharge Volume Long Term Modifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ASB

Statement of Problem:

Concerns raised as a result of the partial failure to scram event at Browns Ferry 3 on June 28, 1980 were documented in the staff's Safety Evaluation Report on the BWR Scram Discharge System dated December 1, 1980. A letter was issued on October 1, 1980 requesting a commitment to conform with revised criteria.

Background:

A letter dated December 9, 1980 forwarded the staff's generic SER with revised criteria. A letter dated March 30, 1981 provided clarification of the requirement for diverse instrumentation.

Current Status:

OMB clearance has been received and orders will be issued in near future.

Actions Required to Complete the MPA:

Obtain acceptable responses and commitment dates. Issue orders with model Technical Specifications. Issue NRC contract to FRC to perform post-implementation verification.

Status updated: April 16, 1982

Multi-Plant Action No. B-59

No. of Plants: 70

Title: Masonry Wall Design

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Charles Trammell

Lead Technical Review Branch SEB, SEPB

Other Review Branches: ____________________

Problem:
Inadequate design criteria for masonry walls. Applies to all plants.

Background:
Problem was discovered at Trojan during reviews associated with IEB 79-02 (anchor bolts) and IEB 79-14 (As-built verification). A masonry wall was found which supported numerous safety-related pipes which was not adequate to resist seismic forces. This resulted in the issuance of IE Bulletin 80-11 on May 8, 1980. NRR (SEB) has been assigned the responsibility to review licensee's responses to this Bulletin.

Current Status:

Franklin Research Center has been contracted to review most licensee submittals (exceptions: Trojan, Cooper, Dresden 1, Humboldt Bay, LaCrosse, Yankee-Rowe, San Onofre 1). Trojan and San Onofre 1 are being reviewed by SEB. LaCrosse and Yankee-Rowe will be reviewed by SEPB. Dresden 1 and Humboldt Bay are currently in a shutdown status, and will be reviewed by SEB if/when needed. Cooper has no safety-related masonry walls covered by IEB 80-11. Close-out letter for Cooper has been issued (2/17/82). Review schedule and acceptance criteria for review have been established.

Actions Required to Complete the MPA:
69 plants remain to be completed. One finished to date. FRC review is active.

Status Updated: 4/16/82

Multiplant Action Number: B-60

Title: Environmental Qualification of Electric Equipment for
Nuclear Power Plants

Lead Project Manager: Jose A. Calvo

Priority: 1

Technical Review Branch: Equipment Qualification Branch

Statement of Problem: All plants are required to meet the Commission Memorandum and Order CLI 80-21 concerning 10 CFR 50, Appendix A, GDC 4.

Background: The issue originated from a 1977 petition from the Union of Concerned Scientists on fire protection and equipment qualification. The multiplant action arose from the Commission Memorandum and Order CLI 80-21. Technical resolution of acceptance criteria were produced from Unresolved Safety Issue A-24.

Current Status: Licensee submittals under review by Franklin Research Center. A proposed rule was issued for public comment on January 20, 1982. Comments were due on March 22, 1982 and are in the process of being evaluated.

Actions required to complete the MPA: Final SERs must be issued for all plants. The schedule for completion, contingent on the proposed rule, will be no later than November 30, 1985.

Status Updated: April 16, 1982

Multiplant Action Number B-61

Title: IE Bulletin 79-27, Loss of Non Class IE Instr. and Control Power

Lead Project Manager: M. Fairtile

Priority: 2

Technical Review Branch(es): ICSB

Statement of Problem:

Loss of "non-nuclear" instrumentation power has caused loss of instruments needed to guide operators to safely shutdown the plant during a concurrent transient caused by the same power loss. In addition erroneous inputs have been fed into the control systems of B&W plants.

Background:

IE Bulletin 79-27 was issued on November 30, 1979 due to a total loss of power to a non-safety class IE 120 volt AC power supply to the Oconee 3 integrated control system and non-nuclear Instrumentation System. On February 26, 1980 there was a power failure in a DC non-nuclear instrumentation system at Crystal River 3 that resulted in both IE and ONRR writing Orders to utilities that hadn't yet responded by February 26, 1980 to the Bulletin.

Current Status:

ICSB has reviewed all the responses to the Bulletin.

Actions Required to Complete the MPA:

DSI will report results of review to DL. The Lead Project Manager is of the opinion that the NRR portion of the Bulletin review can be closed-out by June 30, 1982.

Status Updated: April 15, 1982.

Multi-Plant Action No. B-62

No. of Plants: 70

Title: ESF Reset Control Design Difficiency IE Bulletin 80-06

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: Sydney Miner

Lead Technical Review Branch ICSB

Other Review Branches:

Problem:

Certain equipment would return to its normal mode following the reset of an ESF signal. This protective action of the affected systems could be compromised once the associated actuation signal is reset.

Background:

On March 13, 1980, the Office of Inspection and Enforcement issued Bulletin 80-06, "Engineered Safety Feature (ESF) Reset Controls," to address the concern that the use of reset pushbuttons alone could permit certain engineered safety feature systems components to revert to the normal state following safety system actuation. The bulletin specified actions to be taken by licensee to address these concerns. By Task Interface Agreement, ROI 80-15, the Office of Nuclear Reactor Regulation was assigned responsibility for evaluating the licensee's responses to the Bulletin.

Current Status:

1. Acceptance Criteria
   Unless an alternative is justified by the licensee and the justification is acceptable, upon reset of ESF signals all affected equipment shall remain in its emergency mode. If there is multiple sequencing, none of the reset actions shall cause the affected equipment to deviate from its emergency mode.

2. Important Schedule Considerations
   20 additional licensing actions are scheduled to be completed this year. All of the remaining 15 SERs are scheduled to be issued this year.

3. Identification and Role on the Contractors
   The detailed technical review of the licensees responses to I&E Bulletin 80-06 is being performed by EG&G Sam Ramon under DL's technical assistance contract with Lawrence Livermore National Laboratory. Upon completion of their review EG&G issues a Technical Evaluation Report (TER).

Required to Complete MPA:

1. EG&G complete review and issue TER	4 actions
2. Review TER and issue SER	15 actions
3. Issue SER to licensees	26 actions

Status Updated: 4/16/82

Multiplant Action Number B-63

Title Emergency Procedures and Training for Station Blackout

Lead Project Manager Chris Nelson

Priority High

Technical Review Branch(es) ORB #3

Statement of Problem:

All plants are required to implement emergency procedures and training for station blackout events (loss of all onsite and offsite ac power)

Background:

ASLAB (ALAB-603) concluded that station blackout should be considered a design basis event for St. Lucie 2.

NRC staff currently assessing station blackout on a generic basis (USI A-44)

Station Blackout procedures and training determined advisable action prior to completing A-44.

Current Status:

Generic letter 81-04 sent 2-25-81 requesting all plants (except St. Lucie 1&2) implement emergency procedures and training.

All but three plants have indicated procedures and training will be implemented on an acceptable schedule.

Actions Required to Complete the MPA:

Letters must be sent to 3 acceptable plants closing issue.

Letters must be sent to 2 plants requesting information

Response from one plant must be evaluated

Status Updated:

April 15, 1982

Multiplant Action Number: B-64

Title: B&W Accident Induced Neutron Flux Errors

Lead Project Manager: R. Jacobs

Priority: 3

Technical Review Branch(es): CPB (Physics Section)

Problem:

By letter dated October 29, 1980, B&W (J. H. Taylor) to IE (V. Stello), B&W stated that a study of accident-induced neutron flux errors, indicates a possible error in the FSAR analyses in the non-conservative direction affecting both 177FA and 205FA cores. IE transferred the technical review aspects to ONRR by TIA ROI 80-43 signed by Eisenhut on November 26, 1980.

Background:

By memorandum dated January 14, 1981, Eisenhut to Novak, the Multiplant Program B-64 was established, and transmitted questions, same date, to all B&W licensees. Responses came in dated from mid-March to mid-April 1981. The responses were routed to the Core Performance Branch for review. (H. Richings is reviewer).

Current Status:

All licensee responses submitted to NRC. SERs issued to DL in April 1982.

Actions Required to Complete the MPA.
DL review SERs from CPB and issue them to licensees. No TS changes will be required.

Status Updated: April 16, 1982

Multiplant Action No. B-65

No. of Plants: All BWRs (except LACBWR) - 23

Title: Safety Concerns Associated with Pipe Breaks in BWR Scram System

Lead Project Manager: K. Eccleston

Priority: High

Lead Technical Review Branch: ORAB

Other Review Branches: ASB, PTR, EQB, RAB, AEB, RRAB, CSB, RSB, ORB#2, ICSB, OLB, SPE

Statement of Problem:

Assess the overall risk to long-term core cooling from postulated pipe break in Scram Discharge Volume; investigate the mitigation capability for the postulated event; establish generic recommendations for correcting any deficiencies identified.

Background:

Draft NUREG-0785 issued April 3, 1981 by AEOD described certain safety concerns associated with postulated pipe breaks in the BWR Scram System. NRC letter dated April 10, 1981 to all BWR licensees requested a generic evaluation of the concerns within 45 days and a plant specific review within 120 days. The generic evaluation was submitted by GE on behalf of the BWR owners by letter dated April 30, 1981.

Current Status:

NUREG-0803 was issued to BWR licensees and applicants on 8/31/81. Plant specific licensee responses to concerns identified in this NUREG are being evaluated.

Action Required to Complete the MPA:

Review licensee's plant specific responses to the guidance contained in NUREG-0803.

Status updated: April 16, 1982

Multiplant Action Number B-66

Title Natural Circulation Cooldown

Lead Project Manager Chris Nelson

Priority Medium

Technical Review Branch(es) RSB

Statement of Problem:

All PWRs must review plant cooldown on natural circulation to determine if voiding will occur in the reactor vessel.

Background:

St. Lucie Unit 1, while cooling down on natural circulation due to a component cooling water malfunction, developed a steam space in the upper head of the reactor vessel.

Core cooling was not lost however complex situation deemed on undesirable challenge to the operator.

Current Status:

Generic letter 81-21, issued May 5, 1981, requested:

1. demonstration that natural circulation cooldown by procedure should not result in reactor vessel voiding

2. verification that supples of condensate grade aux feedwater are sufficient

3. aspects of training and procedures dealing with this subject

All licensees but one responded

Westinghouse Owners Group Generic Report (OG-57) dated 4-20-81

Actions Required to Complete the MPA:

Receive outstanding licensee response

Review all responses as well as Generic Westinghouse Report

44 actions remain-none scheduled for FY82

Status Updated:

April 15, 1982

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-67

Title Pressurized Thermal Shock to Reactor Pressure Vessels

Lead Project Manager Guy S. Vissing

Priority 1

Technical Review Branch(es) ORAB, MTEB, RSB, CPB, PTRB, GIB, RRAB

Statement of Problem:

Concerns a possibility that in PWRs pressure vessels could be subjected to severe overcooling transients followed by repressurization which could threaten the integrity of the RPVs.

Background: Pressure vessel thermal shock has been considered for many years in the context of assuring integrity in the vessel when subjected to cold emergency core cooling water during a large LOCA. Based on fracture mechanics analyses verified by enforcements, it was concluded that a postulated flow would not propagate through the vessel wall during a large LOCA. As a result of operating experience it was subsequently recognized that there could be transients in PWRs in which the vessel could be subjected to severe overcooling (thermal shock) followed by repressurization. In these pressurized thermal shock (PTS) transients, vessels could be subjected to pressure stresses superimposed upon the thermal stresses resulting from the temperature differences across the vessel wall. By letter dated April 20, 1981, we requested the PWR Owners Groups to address this problem and the licensees of operating PWRs to provide a response.

On the basis of our review of the PWR Owners Groups' responses and the PWR licensees' responses to our letter of April 20, 1981, and on the basis of our independent analysis, we determined that all operating plants could survive a severe overcooling event for at least another year of full power operation. However, for plants where neutron irradiation has significantly reduced the fracture toughness of the reactor pressure vessels (RPV), we decided that action should be taken to resolve the long term problems. Accordingly, under 10 CFR 50.54(f), by letter dated August 21, 1981 we requested from licensees of eight plants (based on the reference temperatures of the RPV and system characteristics), information concerning the issue of PTS to RPV. Specifically we requested within 60 days information related to: (1) the Reference Temperature for Nil Ductility Transition (RT_{NDT}) for the RPV and (2) operator action to prevent pressurized thermal shock and ensure vessel integrity. Also, we requested within 150 days information which would define actions and schedules for resolution of the PTS issue and analyses to support continued operation.

The eight plants selected were: Fort Calhoun, Robinson 2, San Onofre 1, Maine Yankee, Oconee 1, Turkey Point 4, Calvert Cliffs 1 and Three Mile Island 1.

By Commission Paper SECY 81-687 dated December 8, 1981, PTS was designated as an Unresolved Safety Issue. However, at the Commission briefing of November 24, 1981, we committed to having a staff position by Summer 1982 and by memorandum dated November 24, 1981 (Harold Denton to D. Eisenhut and S. Hanauer) Harold Denton directed that for those plants of immediate concern DL should manage the development of a short term resolution which can meet the scheduled committed to the Commission (Summer 1982).

Current Status:
The "60 day" responses have been received and by letters dated December 18, 1981, we provided to the eight licensees our evaluation and request for information which should be submitted with the "150 day" responses. TACs were issued and closed out for the 60 day responses. TACs have been issued for the short term resolution of the 150 day responses. A TAC has also been issued for the review of the Westinghouse and CE generic reports for the short term resolution for those plants other than the eight. Attachment 1 provides a typical TAC for the eight plants. Attachment 2 provides the TAC for the plants other than the eight. Under Requesting Remarks of each TAC is provided scope of work, responsibilities, plan and tentative schedules.

Action Required to Complete MPA:

Perform SER (one for each plant on one report which addresses all plants), issue and send to licensees.

Multi-Plant Action No. B-69

No. of Plants: 47 Operating Reactor Plants

Title: PWR Main Steam Line Break with Continued Feedwater Addition

(IE Bulletin 80-04)

Priority: High

Cognizant Assistant Director: T. M. Novak

Lead Engineer: R. A. Clark

Lead Technical Review Branch: CSB/DSI

Other Review Branches: RSB, ICSB/DSI

Problem:

A licensee submitted a report to NRC identifying a deficiency in the original main steam line break (MSLB) analysis for their plant. They determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system also had not been considered in prior analyses.

Background:

Virginia Electric and Power Company (VEPCO) submitted a report to the Nuclear Regulatory Commission (NRC) dated September 7, 1979 identifying a deficiency in the original main steam line break (MSLB) analysis for North Anna Power Station, Units 3 and 4. Stone and Webster Engineering Coproration re-analyzed the containment pressure response following a MSLB and determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system had not been considered in prior analyses.

On October 1, 1971, IE Information Notice No. 79-24 was sent to all holders of operating licenses and construction permits, informing them of VEPCO's finding. The Consumer Power Company of Michigan (Palisades, Unit 1 facility) conducted an accident analysis review pursuant to the Information Notice and found that with offsite power available, the condensate pumps would feed the affected steam generator at an excessive rate. This was not considered in their analysis of the MSLB accident.

Because of the deficiencies that were identified in the original MSLB analyses, IE Bulletin No. 80-04 was issued on February 8, 1980. The IE Bulletin requested licensees and certain applicants of PWR facilities to assess the effect of continued feedwater or condensate addition on the containment response and reactor core reactivity response to a MSLB accident. The IE Bulletin was sent to all licensed PWR facilities and to those PWR facilities nearing licensing (Diablo Canyon, McGuire, North Anna 2, Salem 2, and Sequoyah).

Current Status:

As of May 1, 1981, 46 PWR licensees have responded to IE Bulletin 80-04. On August 17, 1981, Franklin Research Center was authorized to begin work reviewing the responses to IE Bulletin 80-04. As of April 16, 1982, Franklin Research Center concluded that some licensee submittals did not provide adequate information for them to complete their review; licensees are being requested to provide the additional information. This assignment is expected to be completed by the contractor by September 30, 1982.

Action(s) Required to Complete the Licensing Action:

1) Review licensees' response to IE Bulletin 80-04.
2) Evaluate licensees' responses.
3) Evaluate licensees' corrective actions.
4) Issue Safety Evaluation Report on licensees' response and corrective actions.

Multi-Plant Action No. C-01
Title: PWR Secondary Water Chemistry
Lead Project Manager: Robert B. A. Licciardo
Priority: 2
Technical Review Branch(es): ChEB

Statement of Problem:

PWR facilities only are affected. The NRC staff's testimony at the January 1976 Prairie Island public hearings on steam generator tube integrity set forth the regulatory position regarding secondary water chemistry monitoring requirements. The NRC position is that monitoring requirements are needed to assure control of harmful impurity buildup in the steam generator that could cause tube corrosion and impair tube integrity.

Background:

Letters were sent to PWRs requesting Technical Specifications changes to incorporate Secondary Water Chemistry monitoring requirements; a number of licensees objected to this approach on the basis of potential limitations to plant operating flexibility. NRC changed its position and requested a license condition that requires the implementation of a secondary water chemistry monitoring and control program containing appropritae procedures and administrative controls.

Current Status:

Six plants remain to be closed out. Many facilities were resolved by ORPM's owing to a lack of Technical Review priority in the post TMI period. Recent scheduling of tasks inside the NRC has made Technical Review capacity again available enabling planning for a relatively early completion.

A contractor is now involved; this is Brookhaven National Laboratories. All actions are scheduled for completion this fiscal year.

Action(s) Required to Complete the MPA:

Outstanding licensee submittals have been reviewed. Requests for additional information have been sent to related ORPMs.

NRR/ORPM is reviewing the request for additional information.

Status Updated: April 16, 1982

Multi-Plant Action No. C-03

No. of Plants: 3 Plants Remaining (Kewaunee, Peach Botton 1&2)

Title: Qualification of Radiation Protection

Priority: N/A

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert Clark

Lead Engineer: Dom DiIanni

Lead Technical Review Branch: NONE

Other Review Branches: DL

Problem:

Issue license amendments commiting the licensee to meeting the requirements of Reg. Guide 1.8 for the qualification of the Radiation protection manager.

Current Status:

All licensees have committed to this requirement and the Tech Specs have been revised accordingly except for the licensee's of the Kewaunee and Peach Bottom 1&2 Nuclear power plants. License amendments for these three plants need to be issued in order to complete MPA. This effort is with DL and it appears the action can be completed during 2nd quarter of 1982.

Action(s) Required to Complete the Licensing Action:

The PMs for Kewaunee (R. Licciardo) and Peach Botton 1&2 (M. Fairtile) are to issue an amendment to the licensee that commits the licensees.

Status Updated 1/21/82

Multiplant Action Number C-04

Title ESF Filter Tech. Specs.

Lead Project Manager C. Tropf

PRIORITY 3

Technical Review Branch (es) ETSB

Statement of Problem:

Some licensee have not submitted T. S. Regarding ESF filters which comply with the position of RG 1.52

Background:

Letters sent out in 1976-1977 to all licensees. Most have been completed.

Current Status:

7 plants are outstanding. All T. S. to be issued by 9/82.

Actions Required to Complete the MPA:

Resolve open items in reviews. Project Managers are pursuing

Status Updated April 1982

Multiplant Action Number: C-06

Title: Pump Support - Lamellar Tearing

Lead Project Manager: R. Emch

Priority: 2

Technical Review Branch: GIB

Statement of Problem:

The potential for low fracture toughness and lamellar tearing on steam generators (including vessel, pressurizer and torus supports) exists due to variability in fracture toughness and resistance to corrosion of support materials.

Background:

Was unresolved safety issue A-12. Additional complication is that supports other than integrally welded are not covered in ASME Code and GDC and may require rule-making. Resolution of issue will occur with issuance of the "Final" NUREG-0577 in early 1982.

Current Status:

1. Acceptance criteria will be provided in NUREG-0577
2. No schedule has been set.
3. GIB/DST (Dick Johnson) has responsibility; however, 6 plants (Indian Point 2/3, San Onofre 1, Turkey Point 3/4, and Arkansas 2) will be reviewed under FRC contract (Bill Koo). These plants did not provide adequate information orginally. Preliminary reviews have been completed onthese 6 plants, but the detailed review is waiting for guidance of NUREG-0577.

Actions Required to Complete the MPA:

Completion of NUREG-0577 is first step. Further steps to be determined based on guidance in NUREG.

Status Updated: January 27, 1982

Multiplant Action Number: C-07

Title: Fuel Handling Accident Inside Containment

Lead Project Manager: C. Tropf

Priority: 2

Technical Review Branch(es):

Statement of Problem:

By letter dated January 3, 1977 to Commissioner Gilinsky, Mr. Robert Pollard recommended that NRR review the potential consequences of a postulated fuel handling accident at each operating plant because this accident had not been considered during licensing of the plants.

Background:

Letters were sent to licensees of 39 operating plants in January 1977 requesting that they provide a detailed evaluation of the potential consequences of this accident. Letters were not sent to licensees of 24 operating plants because this accident had been evaluated in their SER.

Current Status:

There are 4 plants which are not complete. The issues range from concerns regarding X/Q to acceptability of filers.

Action Required to Complete the MPA:

The project managers are pursuing resolution of the remaining issues.

Status Updated: April, 1982

Multi-Plant Action No. C-10

No. of Plants: 54

Title: Control of Heavy Loads at Nuclear Power Plants

Priority: Phase I, High; Phase II, Medium

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert A. Clark

Lead Engineer: Glode Requa

Lead Technical Review Branch: Auxiliary Systems Branch

Other Review Branches: None

Problem: Dropped Heavy Loads may impact spent fuel, fuel in the core, or equipment that may be required to achieve safe shutdown and continued decay heat removal for PWRs and BWRs. If sufficient spent fuel or fuel in the core were damaged and if the fuel is highly radioactive, the potential releases of radioactive material could result in off-site doses that exceed 10 CFR Part 100 limits.

Background: USI - Task A-36 was established to examine staff licensing criteria, the adequacy of measures in effect at operating plants, and to recommend necessary changes to assure the safe handling of Heavy Loads. NUREG-0612 provides the results of the review and includes the task groups recommendation.

Current Status: NUREG-0612 was issued to all licensees by letter dated December 22, 1980. The letter requested; interim actions to be completed in 90 days, a Phase I Action (report, confirmation and justification) in six months and Phase II (specific requirements) in nine months.

The criteria contained in NUREG-0612 is used for the acceptance criteria. Schedules have been established provide 59 technical inputs to DL for FY82 from the contractor for Phase I only. The contractor is Franklin Research Center (FRC). FRC provides TER's to the lead technical group ASB.

Actions Required to Complete the Licensing Action:

1. Review licensees Phase I submittals, resolve any staff disagreements with submittals and issue a SER to licensee.

   50 TERs are to be completed in FY82.
   13 TERs are to be completed in FY83.
   50 SERs to licensees are scheduled for FY82.
   22 SERs to licensees are scheduled for FY83.

2. Review licensee's Phase II submittals same as item 1.

   40 TERs are scheduled for completion during FY83.
   32 TERs are scheduled for completion during FY84.
   40 SERs are scheduled for completion during FY83.
   32 SERs are scheduled for completion during FY84.

Status updated 1/21/82.

Multiplant Action Number: C-11

Title: Reactor Protection System (RPS) Power Supplies

Lead Project Manager: J. Van Vliet

Priority:

Technical Review Branch: ORAB

Statement of Problem:

Design deficiencies have been identified in the BWR RPS MG set regulatory systems that could adversely affect the operability of the RPS if (1) a sequence of undetected single component failures were to occur or (2) a seismic event occurred that resulted in the postulated component malfunctions.

Background:

The design deficiency was first identified during the Hatch 2 licensing process. By letter dated August 7, 1978 the other BWRs were directed to review their designs and submit a report. That letter also directed that a surveillance program be implemented. By letter dated September 24, 1980 the licensees were requested to: (1) commit to installing a Class 1E system, (2) provide a schedule for completion of the modification, and (3) provide a schedule for submitting design information and proposed Technical Specifications. All licensees responded satisfactorily.

Current Status

LLNL is writing TERs based on licensee submittals. ORAB is writing SERs. Vendor delays in delivering monitoring packages have forced three licensees to defer the modification until FY 84. Other deferrals may be necessary. Ten SERs will be issued in FY 82 and seven in FY 83. No unresolved technical issues exist for this item.

Actions Required to Complete the MPA:

1. Review licensee's designs (post-implementation)
2. Review licensee's proposed TS changes
3. Issue license amendment that revises TS

Status Updated: April 16, 1982

Multi-Plant Action No. C-12

Title: Boron Solubility During Long Term Cooling Following LOCA

Lead Project Manager: Tim Colburn

Priority: Medium

Technical Review Branch(es): RSB

Problem:
Review of the Emergency Core Coolign System (ECCS) predicted performance has lead to concerns, for most PWRs designed by Combustion Engineering, regarding the suitability of systems available to prevent boron precipitation during long term cooling following a LOCA. Boron concentrations above the solubility limit would result in precipitation of boron, thus blocking the Reactor Pressure Vessel flow channels and thereby limiting ECCS flow.

Background:
The results of the above review were transmitted to the affected licensees by letters dated 9/7/77 (Palisades), 9/19/77 (Ft. Calhoun and Millstone 2), and 9/27/77 (St. Lucie 1 and Calvert Cliffs 1 and 2). Initial responses were received and a clarification meeting of the NRC staff with the licensees was held on 11/29/77. Additional licensee responses were received as requested during the meeting.

Current Status:
Calvert Cliffs 1 and 2 have addressed this problem in their Technical Specifications to the satisfaction of the ORPM. The OPRM feels licensing action is complete for these units as of 6/16/81. The action for Fort Calhoun is complete as of 3/10/81 with the issuance of an SER to that licensee. Millstone 2 has addressed this problem by establishing procedures for hot leg low pressure safety injection. An evaluation of the adequacy of Millstone 2's procedures in addressing the staff's concerns was transmitted to the licensee by letter dated 6/29/81. The submittal for St. Lucie 1 was evaluated and found acceptable by the staff as per our 3/29/82 letter. The other licensee has completed his response to our generic letter and is awaiting evaluation.

Action(s) Required to Complete the Licensing Action:

1. Approval of the remaining licensing submittal by DSI, specifically RSB.
2. Issuance of Ser to DL for transmittal to licensees by the Project Manager.
3. For those plants not approved (if any) request for additional information or request for Technical Specification change, as appropriate.

Status Updated 4/15/82

Multi-plant Action Number: C-14

Title: SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS

Lead Project Manager: J.T. Beard

Priority: 1

Technical Review Branch(es): ORAB

Statement of Problem

Since TMI-2, great attention has been focused on the ability of PWR's to reliably provide for shutdown decay heat removal at normal system pressure. The steam generator is the preferred and proven choice for accomplishing a safe shutdown of the plant. Therefore, the auxiliary feedwater systems (AFW) should satisfy the seismic design criteria for the Safe Shutdown Earthquake (SSE), consistent with other safety-related systems in the plant. However, only those facilities licensed recently have been reviewed against the NRC Standard Review Plan which treats the AFW as an Engineered Safety Feature.

Background

In August 1980, the NRC completed a preliminary study of the risk of a seismically induced loss of decay heat removal for plants without a seismically qualified AFW. One of the conclusions was that the increase in risk during the next three years is sufficiently small to allow plant operations to continue. Another conclusion was that plants should be surveyed to confirm the extent of the PWR plants without seismically qualified AFW.

In February 1981, the NRC developed and embarked on Multi-plant Action Plan C-14, "Seismic Qualification of Auxiliary Feedwater Systems." An objective to this plan is to increase, to the extent practicable, the capability of those plants without seismically qualified AFW to withstand earthquakes up to the SSE level. This multi-plant plan is described in an NRC memorandum to H. Denton dated February 20, 1981. The first phase is: (1) to identify, via a walkdown of the AFW system, deficiencies ammenable to simple remedial actions, and (2) to survey the plants to determine the extent and areas where significant improvements may be needed. The second phase is to have licensees complete re-analysis and/or significant modifications, for those plants which cannot demonstrate reasonable assurance of the functioning of the AFW system following an earthquake of SSE magnitude. After phase one, the NRC will complete certain decision-making processes and to take action to require licensees to make improvements.

Current Status

In a Generic Letter (GL 81-14), dated February 10, 1981, the NRC requested under 10 CFR 50.54(f) that all operating PWR licensees complete AFW walkdowns and report information regarding the seismic capability of AFW. This action implemented the first phase of the C-14 program.

Lawrence Livermore National Laboratory under technical assistance contract FIN A-0414 is reviewing and evaluating the licensees' responses to GL 81-14. Of the 47 PWRs involved with this MPA, LLNL has found it necessary so far to generate Requests for Additional Information for 44 plants, in order to correct deficiencies in licensees' responses or to obtain technical clarification of the licensees' responses.

In FY81, 2 TACS were completed. To date in FY82, 10 TACS have been completed, in that these plants have AFW designs that do not warrant further attention under this MPA program.

Actions Required to Complete the MPA

Thirty-five plant TACS remain active. LLNL is reviewing licensees' responses to Requests for Additional Information. The objective is to verify that AFW system walk downs were conducted and deficiencies identified, to report the level of seismic qualification of each area of the AFW, and to identify plants for which significant re-analysis and/or modifications may be needed. The results of this evaluation are to be reported both on a per plant basis and in a summary form for all the plants involved.

It is anticipated that LLNL can complete this effort (Phase I of the MPA) about the end of FY82.

Status Update

April 6, 1982.

Multi-Plant Action No.: D-01

No. of Plants: 22

Title: Mark I Containment Program

Priority:

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: D. Vassallo

Lead Engineer: B. Siegel

Lead Technical Review Branch: None - Work to be performed under Technical Assistance Contract

Other Review Branches: ORAB & Chris Grimes

Problem:

Since the original design of the Mark I containment system additional loading conditions resulting from the dynamic effects of drywell air and steam being rapidly furled into the suppression pool during a postulated LOCA and from suppression pool response to SRV operation generally associated plant transient operating conditions have been identified, the objective of this program is to restore the originally intended design safety margins for each Mark I containment system.

Background:

A Mark I Owners Group (OG) with GE the lead technical organization was formed to quantify the hydrodynamic loads and assess the effects of these loads on the Mark I containment structure. The OG divided this task into a short term (STP) and long term program (LTP).

The objectives of the STP were to verify that each Mark I containment system would maintain its integrity and functional capapability when subjected to the most probable loads induced by a postulated design-basis LOCA, and to verify that licensed Mark I BWR facilities would continue to operate safety, without endangering the health and safety of the public, while a methodical, comprehensive LTP was being conducted. The staff in the "Mark I Containment Short-Term Program Safety Evaluation Report," NUREG-0408 concluded that sufficient margin of safety had been demonstrated to assure the functional performance of the containment system and, therefore, any undue risk to the health and safety of the public was precluded.

The objectives of the LTP were to establish design-basis loads that are appropriate for the anticipated life of each Mark I BWR facility (40 years), and to restore the originally intended design-safety margins for each Mark I containment system. The principle thrust of this program has been the development of generic methods for the definition of suppression pool hydrodynamic loading events and the associated structural assessment techniques for the Mark I configuration. The generic anslysis techniques are intended to be

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modified by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review.

Actions Required to Complete the Licensing Action:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: 4/16/82

Multiplant Action Number D-04

Title PWR Reactor Vessel Cavity Seal Ring Missile Potential.

Lead Project Manager Charles Trammell

Priority 2

Technical Review Branch(es) ORB #3

Statement of Problem:

The reactor vessel cavity seal ring can become a missile if left in place during operation should a LOCA occur in or near the reactor vessel cavity.

Background:

Trojan disclosed this as a possible problem via an LER. On 2/2/78, letters were sent to all PWR licensees requesting a solution by either (a) removing the seal ring during operation or (b) confirming by analysis that the seal ring can withstand blowdown forces.

Current Status:

38 plants-completed.

4 plants-remain to be completed:

Haddam Neck

San Onofre 1

Surry 1

Surry 2

The remaining 4 plants have submitted "leak-before-break" analyses in response to MPA D-10, "Asymmetric LOCA Loads." It is expected that NRC will accept this analysis. If so, this will also solve D-4 for these plants, since the seal ring will not become a missile under "leak" conditions.

Actions Required to Complete the MPA:

The resolution of the 4 remaining plants (identified above) is dependent on the resolution of D-10 as described above.

Status Updated:

April 16,1982

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modified by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review.

Actions Required to Complete the MPA:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: April 16, 1982

Multi-Plant Action No. D-05
Title: Plant UPI Model Problem
Lead Project Manager: Robert B. A. Licciardo
Priority: 3
Technical Review Branch: RSB

Statement of Problem:

Only 2 loop PWR's are affected. All Westinghouse (W) 2 loop plants have a Low Pressure Safety Injection System (LPSI) which injects water directly into the Upper Plenum of the Reactor Vessel (UPI). This is used to counter the consequences of a single failure for 2 loop units.

However, the currently approved ECCS evaluation models for two loop plants are based on an ECCS system in which LPSI is directly to the cold leg of the Reactor Coolant System and because of this may be considered as not meeting the requirements of 10 CFR Appendix K Section II.5.

Background:

This has been an outstanding issue for two loop plants since the implementation of Regulations for an approved ECCS system. The issue became a MPA during late 1977 and 1978 when an "interim" model was developed to review the potential effect of UPI against the conventional model.

Current Status:

Six facilities are affected. W 2 loop UPI plants are presently operating on the bases of a number of approaches being taken to determine allowable peaking coefficients in an interim manner.

Acceptable long term resolution involves development of satisfactory generic models with plant specific application. Both W and Exxon fuels are involved.

Contractors are to be involved in the review of proposed models to develop acceptable generic resolutions (1982).

Plant specific applications are proposed for fiscal year 1983.

The Lead Project Manager has reviewed the history and current status of this item, and has made recommendations on future action to expedite completion.

Action(s) Required to Complete the MPA:

Review of Lead Project Managers proposal with RSB and NRR management to develop a mutually acceptable "modus operandi."

A proposal has been made by NRC (R. S. B.) to undertake at least two experiments in the Cylindrical Core Test Facility (CCTF) available in Japan to improve validation of current approaches.

Status Updated: April 16, 1982

Multiplant Action Number: D-10

Title: Asymmetric LOCA Loads on Primary Reactor Coolant System

Lead Project Manager: J. Shea

Priority: Medium

Technical Review Branch(es): MEB, MTEB, CPB, CSB

Statement of Problem:

Asymmetric loads resulting from rupture of the primary piping could potentially damage reactor vessel support internals and other primary system components. Damage to the reactor internals could impair core coolability.

Background:

In January 1978, all pressurized water reactor (PWR) licensees were required by the NRC to provide an assessment of the adequacy of their reactor vessel supports and other affected structures to withstand combinations of responses to asymmetric loss-of-coolant accident (LOCA) loads and the Safe Shutdown Earthquake (SSE). This potential safety problem was subsequently identified as an unresolved safety issue Task Action Plan A-2.

Current Status:

All PWR plant assessments for asymmetric loads have been received and are currently being evaluated by staff and contractor EG&G. As a basis for this evaluation, staff is implementing criteria developed as part of the Task Action Plan A-2. These criteria are included in NUREG-0609. Concurrently, some PWR licensees have performed a study of "leak before break". Staff approval of the "leak before break" concept is expected in April 1982.

Action Required to Complete the Licensing Action:

Complete evaluation of Owners Group submittals including Westinghouse Owners Group proposed "leak before break" concept and plant specific submittals and issue SER.

Status Updated: April 13, 1982

Multiplant Action Number: D-12

Title: BWR Non Jet Pump Core Spray Performance

Lead Project Manager: P. J. Polk

Priority: 3

Technical Review Branch: ORAB

Statement of Problem:

Core Spray System nozzle coverage differs in a steam environment vis-a-vis an atmospheric environment. The original design is based on atmospheric analyses and tests. The generic issue requires that nozzle coverage be reanalyzed to reflect the steam environment.

Background:

History is inappropriate since only one plant remains outstanding.

Current Status:

All non-Jet Pump BWRs have either made the necessary modifications or committed to same with the exception of Nine Mile Point.

1) Acceptance criteria to be used in resolving the issue; to be provided by ORAB
2) Important schedule considerations; None (low Priority)
3) Where more than one review branch is involved, responsible branches with a breakdown of each branch's responsibilities; (ORAB Only)
4) Identification and role of contractors; None

Actions Required to Complete the MPA:

Review and approval of both the Oyster Creek and Nine Mile Plants is necessary to complete this generic activity.

Status Updated: April 16, 1982

Multi-Plant Action No. D-15

No. of Plants: 70

Title: High Energy Line Break and Consequential System Failure

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch EQB, RRAB, GIB

Other Review Branches:

Problem: Certain non-safety grade equipment, if subjected to an adverse environment, could impact the safety analyses and the adequacy of the protective functions performed by safety grade equipment. The NRC is concerned that a potential may exist at operating light water reactor facilities, for an unreviewed safety matter related to the effects of the environment on control systems resulting from high energy line breaks inside or outside containment and the results of these effects on the required safety systems.

Background:

On September 17, 1979, the NRC requested that all LWR licensees review their plants to determine whether control system failures caused by high energy line breaks (HELB) could result in consequences more severe than previously analyzed for the HELB. All licensees responded in a timely manner (20 days). A status reported from D. G. Eisenhut to H. Denton dated October 15. 1979 provided a basis for continuing operation. A meeting with representatives of the nuclear industry was held on November 9, 1979. A status report P. S. Check to D. G. Eisenhut dated December 19, 1979 stated that the NRC task group had found no specific identified safety problems. There were remaining concerns which fall within the scope of NUREG-0660 II.C.3.

Current Status:

All TAC's issued on this subject are still open. A memo is in concurrence which includes instructions to PM's to close the issue and sent a letter to each utility informing them that any continuing effort by the staff will be under NUREG-0660 II.C.3.

Actions Required to Complete the MPA:

The above memo needs the concurrence of the AD/T DST who is responsible for the review. Following this each PM would receive the above instructions.

Status Updated: 4/16/82

Multiplant Action No.: D-16

Title: Review of Corporate Management Capability

Lead Project Manager: Sydney Miner

Priority: Low

Technical Review Branch(es): Licensing Qualification Branch

Statement of Problem:

To develop criteria and review for conformance to the criteria for onsite and offsite organizations, both management and technical, that will assure the safe operation of the plants during normal and abnormal conditions and the capability necessary to respond to accident situations.

Background:

In a letter dated June 29, 1979, shortly after the TMI-2 accident, we requested all power reactor licensees to supply information on their specific management and technical resources.

Upon review of the licensees' responses, we sent a second letter in February of 1980 stating that additional information is necessary to complete the evaluation. We also informed the licensees at that time that an outside contractor (Technicron Research, Inc.) in assisting the NRC in developing criteria, would contact them and request the information concerning their utility. Technicron reviewed the responses and the results of their effort were published in NUREG/CR-1656.

Subsequently, the Licensee Qualification Branch (LQB) developed guidelines and published them in NUREG-0731. The LQB are currently re-evaluating these guidelines.

Current Status:

The LQB is currently developing acceptance criteria for Corporate Management Capability and has let a contract to Pacific Northwest for the work. The Pacific Northwest effort is expected to be completed about the end of this calendar year. There are no licensing actions scheduled to be completed this year.

Action(s) Required to Complete MPA:

1. Issuance of guidelines by LQB.
2. Issuance of requirements by NRR to all operating plants.
3. Review of licensees' responses.
4. Issuance of a Safety Evaluation Report.

Status Update: 4/16/82

Multiplant Action No.: D-17

Title: Definition of Operable

Lead Project Manager: Sydney Miner

Priority Medium

Technical Review Branch(es): None

Statement of Problem:

Clarification of the term "OPERABLE" as it applies to support system outages or multiple outages of redundant components.

Background:

In a letter dated April 10, 1980, an explanation of the problem plus accompanying illustrate examples of recommended changes contained in the associated bases, were delineated to all licensees. The licensees were required to submit proposed changes to tech specs applicable to their plant and to implement procedures designed to assure compliance with the specifications containing new requirements.

Current Status:

1. Acceptance Criteria
   The acceptance criteria that LCO should be incorporated in the Technical Specification which requires that the plants be in cold shutdown within 36 to 39 hours if redundant ECCS loops become inoperable either due to failures in redundant ECCS loops or the diesel generators.

2. Important Schedule Considerations
   No licensing actions are scheduled to be completed this year.

3. Review Responsibilities
   This MPA is being handled completely within the Project Management Organization.

Actions Required to Complete MPA:

1. Remaining Milestones

   (a) Approval of remaining changes to the Technical Specifications of the remaining plants.

   (b) Issuance of the SER and the License Amendments.

2. Plant Actions Remaining

   There are 17 remaining licensing actions.

Status Updated: 4/16/82

Multiplant Action Number: E-04

Title: BWR Single Loop Operation

Lead Project Manager: Dick Clark

Priority: Low

Technical Review Branches: RSB, CPB

Statement of Problem:

The standard BWR Technical Specifications do not permit a plant with two recirculation loops to operate either with one loop or in the natural circulation mode. Thirteen operating BWRs have requested approval to operate at reduced power levels with a single loop if problems develop with a jet pump, valve, seals, flow controller, etc., in the other loop. Most of the potential safety reviews can more appropriately be resolved on a generic basis.

Background:

Single loop operation at limited power levels had previously been authorized for 6 BWRs for short periods of time (one week to two months). Based on this operating experience, the staff has concluded that BWRs can be safely operated at least 50% power by natural circulation (i.e., without forced flow from any recirculation loop). Accordingly, as an interim measure, for those licensees who modified their application, the plants have been authorized to operate, if necessary, at power levels of 50% with a single recirculation loop. For operation above 60% power, there is a generic concern involving flow stability when operating with one rather than two recirculation loops.

Current Status:

A meeting was held October 22, 1981 with all BWR licensees and GE to discuss GE's evaluation of Browns Ferry's and other BWR operating experience with single loop operation. RSB and CPB have prepared a draft list of questions which we discussed in a meeting with GE on January 21, 1982.

Actions Required to Complete the Licensing Action:

Transmit requests for additional information to licensees. Review and evaluate responses. Prepare safety evaluations authorizing plants to operate on a single loop at power levels indicated by the revised ECCS analysis.

Status Updated: pril 16, 1982

Multi-Plant Action No. E-05
No. of Plants: 3
Title: Westinghouse N-1 Loop Operation
Priority: Low
Cognizant Assistant Director: T. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: L. Olshan
Lead Technical Review Branch: RSB
Other Review Branches: ICSB

Problem:

All Westinghouse plants have a provision in their license that prohibits operation with less than all loops (N) in service.

Background:

It may be desirable to operate plants with one loop out of service. Present restrictions in the license do not permit this type of operation.

Current Status:

Only three Westinghouse plants, Beaver Valley and Zion (1 and 2), have submitted proposed amendments for N-1 loop operation. Beaver Valley is lead plant and most of the review has been completed.

Action(s) Required to Complete the Licensing Action:

NRC to review contractor (Franklin Inst., Lawrence Livermore) inputs and write SER on Beaver Valley. Zion review to follow. Other Westinghouse pLants will probably submit similar applications if Beaver Valley is approved.

Multiplant Action Number E-06

Title CEA Position indication

Lead Project Manager Monte Conner

Priority 2

Technical Review Branch(es) ICSB

Statement of Problem:

Should we allow the use of the fully inserted or withdrawn reed switches for TS position indications.

Background:

Several licensees with CE designed NSSS requested substitution of fully inserted or withdrawn reed switches for either one of the two other CEA position indication systems required by the STS for reactor startup or change of mode.

Current Status:

By memo dated January 5, 1982, ICSB notified DL that the proposed Millstone 2 TS were unacceptable. No substantial justificaton was provided, however acceptable TS were enclosed. These TS are nearly indentical to the current Calvert Cliffs TS except for one paragraph that allows use of mimic lights to substitute for reed switch position indication.

Actions Required to Complete the MPA:

1. Prepare SE and issue proposed TS to Millstone-2. Such an amendment has been issued for Calvert Cliffs 1 and 2.
2. Issue letters to other CE units informing them of new acceptable T.S.

Status Update

April 15, 1982

Multiplant Action Number E-07

Title Reactor Protection System Logic for CE Facilities

Lead Project Manager Monte Conner

Priority Completed

Technical Review Branch(es) ICSB

Statement of Problem:

A TS discrepency exists in the length of time the fourth RPS channel may be bypassed at CE designed facilities.

Background:

In the Calvert Cliffs and St. Lucie STS, the RPS is controlled as a 2-out-of-4 logic system. However, the same RPS is operated as a 2-out-of-3 logic system with an installed spare in accordance with the Millstone-2 STS and the Ft. Calhoun, Maine Yankee and Palisade custom TS.

Current Status:

ICSB prepared a memo to provide our justification for requiring the above licensees to accept the 48 hour bypass TS. This memo also provides criteria for longer bypass based on system separation and related requirements. Letters were issued to the involved licensees on March 31, 1982.

Actions Required to Complete the MPA:

Closed as MPA; any resultant TS changes to be handled on plant-specific basis.

OPERATING REACTORS LICENSING ACTIONS SUMMARY

Manuscript Completed: June 1982
Date Published: June 1982

Prepared for: OFFICE OF NUCLEAR REACTOR REGULATION

Prepared by: OFFICE OF RESOURCE MANAGEMENT
U.S. NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555

FOREWORD

THE OPERATING REACTORS LICENSING ACTIONS SUMMARY IS DESIGNED TO PROVIDE THE MANAGEMENT OF THE NUCLEAR REGULATORY COMMISSION (NRC) WITH AN OVERVIEW OF LICENSING ACTIONS DEALING WITH OPERATING POWER AND NONPOWER REACTORS. THESE REPORTS UTILIZE DATA COLLECTED FROM THE DIVISION OF LICENSING IN THE OFFICE OF NUCLEAR REACTOR REGULATION AND ARE PREPARED BY THE OFFICE OF MANAGEMENT AND PROGRAM ANALYSIS.

THIS SUMMARY REPORT IS PUBLISHED PRIMARILY FOR INTERNAL NRC USE IN MANAGING THE OPERATING REACTORS LICENSING ACTIONS PROGRAM. ITS CONTENT WILL CHANGE BASED ON NRC MANAGEMENT INFORMATIONAL REQUIREMENTS.

Section 4 Multiplant Action Descriptions for Active Issues

Definitions

I. Licensing Actions

A. Active Licensing Action - an item which has been initiated but not completed.

1. Multi-Plant Licensing Action - a licensing action topic that applies to a class of reactors.
2. Plant Specific Licensing Action - a licensing action associated with a certain facility because of the uniqueness of the technical specifications or situation, e.g., reduce the number of incore detectors.

B. Types of Licensing Actions

1. Amendment - action that results in changes to facility licenses including technical specification changes.
2. Letters to Licensees - letters sent to licensee requesting information that will resolve or aid in the resolution of technical issues. Examples of letters sent to licensees are: fuel handling inside containment, assymmetric loads or reactor vessel materials surveillance.
3. Orders/Exemptions - actions on operating plant that result in an Order for Modification of a License or an exemption to the regulation.

C. Categories of Multiplant Actions

1. Regulation - actions directly attributed to a specific regulation requirements, e.g., inservice inspection/testing requirements 10 CFR 50.55a(g).(A-Series)
2. Operating Experience - action directly attributed to an occurrence of accumulative experience at licensed reactors e.g., fire protection. (B-Series)
3. Internal Review - action resulting from NRC staff reviews of license applications, generic topics and operating reactor licensing actions, e.g., reporting requirements, fuel handling accidents, or filter tech spec requirements. (C-Series)

4. New Information - action required as a result of current data which shows that previously accepted requirements are no longer acceptable or are overly restrictive, e.g., ECCS input errors, assymmetric loads, equipment qualification. This new information may result from technological advancements, research or advanced analytical studies. (D-Series)

5. Licensee Requests - action requested by the licensee that does not fit any of the other sources of licensing actions. Usually these actions are requested because of the licensee's desire to improve operational performance, e.g., core reloads, spent fuel pool modifications, or (N-1) loop operation.(E-Series)

6. TMI Related Actions - actions related to the TMI Action Plan. (F-Series)

II. Significant Dates

A. Initiation - This is the date an action was actually started or implementation was begun on a plant. It is the date that a letter was issued to the licensee initiating the action, the date of an amendment request, or the date a TAC was issued for an item arising out of an operating experience or new information event.

B. PM-Target - project manater's anticipated completion date for active items.

C. Licensing Action Complete - date on which all work, both technical and administrative was completed and sent out of the agency.

III. Definition of Priorities (Applicable to Multi-Plants or Plant Specific Actions)

A. High (1)

1. Required by Rule, Order or NRC Letter
2. Safety-related items that use definite improvements in safety or would reduce the likelihood of transients or accidents.
3. Hearing-related matters.
4. High public interest in issue.
5. Actions which, if not completed, will affect power level or scheduled restart of a facility.
6. § 2.206 petitions.

B. Medium (2)

1. Items which, if not completed could result in an otherwise unnecessary IE enforcement action.
2. Spent fuel pool expansions.
3. Task should be completed within six months.

C. Low (3)

1. Licensee requests for amendments that have low safety significance.
2. Licensee requests for amendments which may have safety significance but for which NRC action is not required during the next six months (e.g., in early submittal of a core reload).

OPERATING REACTORS HEARING SUMMARY

Status as of May 30, 1982

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Big Rock Point	R. Emch	M. Karman	Mixed Oxide Fuel	8/75	In indefinite suspension as a result of GESMO decision.
Big Rock Point	R. Emch	J. Moore	Spent Fuel Pool Expansion	9/25/79	Evidentiary hearing currently scheduled for 6/7/82
Browns Ferry 1/2/3	R. Clark	R. Rawson	Onsite Storage of Low Level Waste	1/81	ASLB denied petitions to intervene. Appeal Board remanded issue back to ASLB and reinstated intervenors. Staff and TVA has appealed decision to the Commission. The Commission ordered briefs to be filed by the staff and TVA by May 6, 1982. Staff evaluations due to ASLB by May 1, 1982. Prehearing conference held April 1, 1982 in Huntsville, AL.
Dresden 1	P. O'Connor	R. Rawson	Decontamination	9/30/81	First Prehearing Conference has not yet been held. Contentions remain pending.
Dresden 2/3	P. O'Connor	R. Goddard	Spent Fuel Pool Expansion	9/21/78	An initial Decision has been issued by the ASLB (5 out of 33 racks for Unit 3 only) permitting partial re-racking pending resolution of seismic questions.
Dresden/Quad Cities	R. Bevan	R. Goddard	Shipment of Spent Fuel	8/22/78	Special prehearing conference held February 1, 1979. Hearing not yet scheduled.
GETR	C. Nelson	D. Swanson	Seismic Show Cause Issues	10/24/77	Testimony completed; awaiting Initial Decision.
Ginna	J. Lyons	M. Young	Full Term Operating License Conversion	6/8/73	Litigation is being held in abeyance until completion of SEP.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Humboldt Bay	V. Rooney	M. Young	Deletion of Seismic Conditions	7/29/77	Motion to withdraw application for license amendment and to terminate the proceeding filed by the licensee on December 31, 1980. By memorandum and order dated February 17, 1982 the ASLB ordered the licensee to file status reports each 3 months. The ASLB also ordered that 6 months after the Commission reaches a decision on safety goals and issues guidelines the licensee must report to the Board a) readiness to take actions to permit resumed operation, or b) commit to submit a decommissioning plan.
LaCrosse	R. Dudley	C. Woodhead	Full Term Operating License (with seismic considerations)	6/23/78	Motion for summary disposition of environmental contentions is pending before ASLB. The proceeding has recommenced following consolidation of seismic issue from Show Cause (2.206) proceeding with FTOL proceeding. The FTOL proceeding is contingent upon the completion of the SEP for the facility.
Maine Yankee	C. Nelson	J. Gutierrez	Spent Fuel Pool Capacity Expansion	9/18/79	First Prehearing Conference completed. Two intervenors admitted. April 12, 1982 ASLB Order admits 14 contentions.
North Anna 1/2	L. Engle	D. Swanson	Turbine Missile Risk	2/27/78	Testimony completed; awaiting ASLAB to close or reopen hearing. In a letter dated 2/26/82 to the licensee, the ASLAP stated that it had concluded that there is no necessity for an additional evidentiary hearing regarding turbine missiles. It is now assumed the issue will be decided by the Board on the record as it now stands.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Palisades	T. Wambach	C. Barth	Steam Generator Repair Program	7/23/79	Staff is awaiting licensee's decision to proceed with the repair program. Therefore, litigating efforts are being held in abeyance.
Point Beach 1/2	T. Colburn	R. Bachman E. Shomaker	Determination on Proprietary Nature of Westinghouse Documents Related to Steam Generator Tube Sleeving	7/20/81	Testimony in progress. Discovery complete. Parties now responding to Board questions. No decision on hearing date.
Point Beach 1/2	T. Colburn	R. Bachman	Steam Generator Tube Sleeving	7/20/81	Testimony in progress. Parties have filed motions to compel responses to discovery. Hearing date decision dependent on issuance of staff SER and EIA.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Quad Cities	R. Bevan	R. Goddard	Spent Fuel Pool Expansion	4/30/81	Petitions for leave to intervene have been filed. Prehearing Conference held on October 14, 1981. Prior to hearing scheduled for May 11, 1982, intervenors withdrew contentions and request for hearing. Board expected to issue order terminating Hearing.
Rancho Seco	M. Padovan	R. Black	Commission Order of May 7, 1971, related to TMI Related Modifications.	5/15/79	Initial Decision of ASLB under review by ASLAB sua sponte.
Salem 1	W. Ross	B. Smith	Spent Fuel Pool Modifications	3/7/78	Initial Decision issued October 27, 1980 authorizing amendment; affirmed by ASLAB on July 17, 1981 (ALAB-650). Commission declined review on November 9, 1980). Appeal has been filed before 3rd. Circuit Court of Appeals.
Three Mile Island 1	R. Jacobs	J. Gray J. Cutchin J. Goldberg	TMI-1 Restart	8/79	Initial Decision issued; before the Commission for determination of immediate effectiveness. (ASLB decision on issues related to cheating incident is not yet issued.)

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Palisades	T. Wambach	S. Burns	Plant Operator's Union Opposition to Overtime Limits Imposed on Licensee by IE Order Related to TMI Requirements.	3/9/81	Request for hearing denied by ASLB. On March 31, 1982 the ASLAB reversed the decision by the ASLB and remanded the case for further proceedings.
Robinson 2	G. Requa	S. Treby	Radon	11/30/73	Partial Initial Decision issued by ASLB; affirmed by ALAB on October 31, 1979 (ALAB-569). Pending before ASLAB on radon only.

Notes:

/1 Orders were issued January 13, 1981, requiring modifications and report submittals.

/2 Orders were issued October 24, 1980, requiring submission of reports.

/3 All SERs contained open items requiring further submittals from licensees.

/4 Resolution resulted in a revised Section 5.4.7 of the Standard Review Plan in lieu of a formal report. A generic letter on this subject will be issued in the future.

/5 A rulemaking proceeding is currently in progress. No further plant specific licensing action will occur pending completion of rulemaking.

Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.59a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests is being reviewed by a contractor (SAI). After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant specific basis with a schedule keyed to inspection program update requirements.

Actions Requred to Complete the MPA:

Thirty-nine facilities remain to be reviewed in FY-82 in accordance with the attached schedule. Thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 6/17/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.
3. DL issue license amendment.

Status Updated: 6/16/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Lead Project Manager: W. Paulson

Priority: 1

Technical Review Branch(es): CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center is under contract for performing the review of the 47 remaining plants in this program. All (46) TERs have been received from Franklin Research Institute. No TER is expected for Dresden 1 which is on hold. Forty SERs have been forwarded to DL by CSB; three of these need further work. Nineteen licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on 12 SERs in preparation for issuance. CSB needs to complete 6 SERs plus rework 3 SERs.

Status Updated: ____________

Multiplant Action Number A-10

Title Contingency Planning

Lead Project Manager E. McPeek

Priority High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

    a. 10 CFR Part 73, Appendix C
    b. Regulatory Guide 5.44
    c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint.. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (4) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-11

Title: Guard Training PLans

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary)	Power Reactor Safeguards Licensing Branch, NMSS
(Secondary)	Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:
    a. 10 CFR Part 73, Appendix B
    b. NUREG-0674
    c. NUREG-0219
    d. NUREG-0576
2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.
3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and ten (10) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued..

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by ORPMs, MEB and a contractor (EG&G). After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements. Twenty-six of the backlog facilities will be reviewed by the regions initially with more to follow in the future.

Actions Required to Complete the MPA:

Sixty-four facilities remain to be reviewed in FY-82 in accordance with the attached schedule. For the reviews being conducted by MTEB or the contractor, thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 6/17/82

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number A-15

Title Quality Assurance Request Regarding Diesel Generator Fuel Oil

Lead Project Manager G. S. Vissing

Priority Low (3)

Technical Review Branch(es) PM ORB#4

Statement of Problem:
Consumable items where quality is necessary for functional performance of safety related components should also be classified as safety related and thus subject to applicable provisions of Appendix B to 10 CFR 50. DG fuel oil should therefore, be on the Q list or included in the QA program.

Background:
At ANO-1 IE found that DG fuel oil was not on their Q list or in their QA program. On investigation, we found this to be the case in other plants as well. Therefore, in January 1980, we requested all licensees to check their QA programs with respect to DG fuel oil and to include DG fuel oil in their QA programs or provide justification for not doing so.

Current Status:
Issue is complete for all affected plants.

Actions Required to Complete the MPA:
None

Status Updated 4/15/82

Multi-Plant Action No. A-16

Title: Qualification of Inspection, Examination, Testing and Audit Personnel

Lead Project Manager: Dave H. Jaffe

Priority; I

Technical Review Branch: QAB

Statement of Problem:

Guidance for the qualification requirements for inspection, examination, testing, and audit personnel has been incorporated in Regulatory Guides 1.58, Revision 1, and 1.146. This guidance should be implemented in a uniform manner by all power reactor licensees.

Background:

On May 4, 1981 Generic Letter 81-01 was sent to power reactor licensees and CP holders to request commitments to comply with certain regulatory positions presented in the subject Regulatory Guides.

Current Status:

All operating reactor licensees have responded to Generic Letter 81-01 and these responses are under review in QAB against the criteria of Regulatory Guide 1. 146 and Positions C.5, 6, 7, 8, and 10 of Regulatory Guide 1.58, Revision 1. As of June 15, 1982, MPA-A-16 has been resolved for 50 of the 72 scheduled facility reviews.

Action(s) Required to Complete the Licensing Action:

A close out letter is to be sent to licensees who provided an acceptable commitment to Regulatory Guides 1.58, Revision 1, and 1.146. As of June 15, 1982 letters have been sent closing out 50 of the 72 scheduled reviews.

Status Updated June 17, 1982

Multiplant Action No: B-01

Title: Diesel Generator Lockout

Lead Project Manager: T. Wambach

Priority:

Technical Review Branch(es): ORAB

Problem:

Some failures-to-start of diesel generators have been attributed to diesel generator lock-out involving critical timing of control circuit relay operation or reset following manual shutdown of the diesel. IE has transferred responsibility to Licensing to determine whether similar circuitry problems exist at other facilities and what corrective measures should be implemented.

Background:

By memo dated 1/26/77, DOT has requested that a survey be made of all operating plants to determine whether lockout or diesel generator operability is specifically annunciated in the control room for each diesel generator. A letter was sent to all operating reactors in March 1977. Review of responses has been completed.

Current Status:

Of the 63 units, 59 have been completed. NRC technical position has been documented to DL by ORAB.

Action(s) Required to Complete the Licensing Action:

Forward position to licensees of 4 remaining units. Obtain licensee commitment to meet position and write final letter closing out. The remaining 4 units are: Browns Ferry 1, 2, 3 and Davis-Besse.

Status Updated: June 16, 1982

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:
All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; (c) Technical Specifications. Twelve plants remain for which licensing action is required. SERs are available for three of the plants with only PM processing required. The remaining nine plants are being reviewed by contract with EG&G for reactor system aspects through RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the nine plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 6/16/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1

Lead Project Manager: Dick Clark

Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operating licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. Initial responses were received from all but one licensee and from all near-term applicants for operating licenses.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions Required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. Since MTEB could not begin the reviews this fiscal year, the reviews are being performed by INEL/EG&G. A revised statement of work, including MPA B-05, was mailed to the contractor on March 8, 1982. INEL has submitted a revised 189. Priority is being given to completing the reviews on those BWRs with furnace sensitized safe ends. A total of 23 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY83.

Status Updated: June 17, 1982

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:
By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:
1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize hydraulic snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-17 actions.
3) A total of 33 actions have been completed to date:

Actions Required to Complete the MPA:
1) 30 actions have been completed to date for FY82.
2) 0 additional actions required to meet FY82 schedule.

Status Updated: 6/17/82

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem:

OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize mechanical snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-22 actions.
3) A total of 41 Actions have been completed to date.

Actions Required to Complete the MPA:

1) 24 actions have been completed to date for FY82.
2) 1 additional action required to meet FY82 schedule.

Status Updated: 6/17/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Lead Project Manager: R Dudley

Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1982. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

67 - operating plants covered by B-23
56 - SERs completed (7 of which have open items)
45 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 11 remaining SERs. Complete the 22 remaining licensing actions.

Title: Venting and Purging Containment While at Full Power and Effect of LOCA

Priority: High

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: S. Varga

Lead Engineer: E. Reeves

Lead Technical Review Branch: CSB/DSI

Other Review Branches: EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980 and March 24, 1981 to all OL OR Branch Chiefs and Project Managers and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are managed by the Technical Review Team as follows:

   a. Electrical Reviews are managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews are managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements are managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews are managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB #1 (concurred in by CSB/DSI) was prepared for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review will complete TMI Item II.E.4.2, except for II.E.4.2.5 Containment Pressure Setpoint. However, CSB/DSI will provide SER's for II.E.4.2.6 and II.E.4.2.7 or will concur in SER's developed by Project Managers

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Project Managers should issue the update status of NRC reviews as soon as possible to each licensee using the sample letter (4 above). This is important to get the issue clearly understood by each PM and each licensee and to get the action completed. Lead PM records show that sixteen (16) plants have not been sent the status letter per the June 19, 1981 instructions. This letter should contain the staff guidance and any existing staff SER's received to date.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SER's and provide to Project Manager. Technical reviewers should also provide a status report to the Lead PM on TER's and SER's on a monthly basis.

3. Project Managers should review the licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

4. TMI Item II.E.4.2.5 reviews by CSB have been completed. SER's have been issued to licensees except for Crystal River 3 and Palisades. Project Managers should complete this action.

Status Update: 4/15/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking

Lead Project Manager: P. W. O'Connor

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Thirteen plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Ten plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements.

Actions Required to Complete the MPA:

Complete the review of the deviations on the eleven remaining plants. Obtain commitments to follow NUREG-0619 guidance or issue orders requiring compliance if necessary.

Status Updated: June 18, 1982

Title: Long Shaft LHSI and Outside Recirc Pump Degradation
Priority: Low
Cognizant Assistant Director: T. M. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Neighbors
Lead Technical Review Branch: EQB
Other Review Branches: ________________

Problem:

Upgrade pumps at plants which have long shaft pumps. There were five plants in this category.

Background:

Excessive degradation occurred to bearings and shaft after short periods of operation of these pumps. Problems originally occurred at North Anna.

Current Status:

Complete.

Action(s) Required to Complete the Licensing Action:

None.

Status Updated: 4/6/82

Multi-Plant Action No. B-32

No. of Plants: 5

Title: Blocked SI Signal During Cooldown

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch ORAB (contractor)

Other Review Branches:

Problem:
NRR/DOL was requested by IE to determine the acceptability of blocking the steam line differential pressure safety injection signal during cooldown simultaneously with the blocking of the coircident pressurizer low level and low pressure signal. All PWR's should be reviewed for the same problem.

Background:
During an inspection at H. B. Robinson 2, it was found that during cooldown the licensee blocks the safety injection initiation signal from the high differential pressure between steam lines and the steam line header. This block is hard-wired into the same switch that is used to block the pressurizer low pressure and low level safety injection signal when primary pressure is below 2000 psig. The technical specifications (Table 3.5-3) allow blocking the pressurizer signals but do not address the blocking of the steam line high differential pressure signal.

We have also determined that Surry 1 and 2 and Turkey Point 3 and 4 have the same instrument and signal blocking arrangement and technical specification requirements as H. B. Robinson 2.

Current Status:

Robinson 2 submitted an amendment request and the amendment has been issued. A contractor report has been transmitted to the lead PM.

Actions Required to Complete the MPA:

The contractor report indicated that there are a total of 18 facilities that appear to have the same arrangement (10 sites). The lead PM is working out a plan of action to take. New TACs will be issued.

Status Updated: 6/16/82

Multiplant Action Number B-36

Title RTD Response Time

Lead Project Manager Monte Conner

Priority 2

Technical Review Branch(es) ICSB

Statement of Problem:

To accurately determine the response time for RTD used in the RPS.

Background:

With the adaptation of the STS definition of RPS response time requirements for primary sensors, the RTD portion of the response time became a difficult value to obtain. If the RTD is removed from its well in the RCS piping, how do you account for the well effect in finding the response time? New methodologies are now available to measure RTD response times directly during reactor operations.
